To ensure that you have a more comfortable experience before you choose to purchase our Analytics-Admn-201 exam quiz, we provide you with a trial experience service. Once you decide to purchase our Analytics-Admn-201 learning materials, we will also provide you with all-day service. If you have any questions, you can contact our specialists. We will provide you with thoughtful service. With our trusted service, our Analytics-Admn-201 Study Guide will never make you disappointed.

Salesforce Analytics-Admn-201 Exam Syllabus Topics:

Topic	Details

Topic 1	<ul style="list-style-type: none"> • Connecting to and Preparing Data: This section of the exam measures the skills of Tableau Administrators and covers the basic understanding of Tableau Server's interface, navigation, and overall topology. Candidates are expected to recognize both client and server components, understand how these interact, and know where to find information about versions, releases, and updates. It also focuses on system requirements, including hardware, operating systems, browsers, email configurations, cloud considerations, and licensing models. Additionally, it examines knowledge of server processes, data source types, network infrastructure, and ports needed for a stable deployment.
Topic 2	<ul style="list-style-type: none"> • Troubleshooting: This section of the exam measures the skills of Support Specialists and covers resolving common Tableau Server issues. Candidates must know how to reset accounts, package logs, validate site resources, rebuild search indexes, and use analysis reports. It also includes understanding the role of browser cookies and creating support requests when needed.
Topic 3	<ul style="list-style-type: none"> • Administration: This section of the exam measures the skills of Tableau Administrators and covers the day-to-day tasks of maintaining Tableau Server. Candidates should understand how to create and manage schedules, subscriptions, backups, and restores, as well as how to use tools such as TSM, Tabcmd, and REST API. It emphasizes monitoring, server analysis, log file usage, and embedding practices. It also includes managing projects, sites, and nested structures, while contrasting end-user and administrator abilities. Knowledge of publishing, web authoring, sharing views, caching, and data source certification is also tested.
Topic 4	<ul style="list-style-type: none"> • Installation and Configuration: This section of the exam measures the skills of Server Engineers and covers the process of installing Tableau Server, understanding installation paths, identity store options, SSO integrations, SSL setup, and silent installs. Candidates also need to demonstrate the ability to configure Tableau Server by setting cache, distributing processes, customizing sites, and configuring user quotas. It further includes adding users, managing their roles and permissions, and applying Tableau's security model at different levels from sites to workbooks.
Topic 5	<ul style="list-style-type: none"> • Migration & Upgrade: This section of the exam measures the skills of System Engineers and covers the process of upgrading and migrating Tableau Server environments. Candidates should understand how to carry out clean reinstalls, migrate servers to new hardware, and maintain backward compatibility during the process.

Analytics-Admn-201 Actual Braindumps - Analytics-Admn-201 Exams Torrent

The Exams4Collection experts regularly add these changes in the Exams4Collection Analytics-Admn-201 exam dumps questions so that you do not miss a single Analytics-Admn-201 exam update. With the purchasing of Exams4Collection Analytics-Admn-201 exam practice questions you get an opportunity to get free Exams4Collection Analytics-Admn-201 Exam Dumps questions updates for up to 1 year from the date of Exams4Collection Analytics-Admn-201 exam questions purchase.

Salesforce Certified Tableau Server Administrator Sample Questions (Q24-Q29):

NEW QUESTION # 24

What should you do to disable table recommendations for popular data sources and tables to users?

- A. Publish data sources only to projects with permissions locked to the project
- B. Disable the option using the server Settings page
- C. Use the command: tsm configuration set -k recommendations.enabled -v false
- **D. Disable the option using the site Settings page**

Answer: D

Explanation:

Table recommendations in Tableau Server suggest popular tables and data sources to users when they create new content in the web authoring environment. This feature is enabled by default but can be disabled at the site level.

Option A (Disable the option using the site Settings page): Correct. A site administrator can disable table recommendations by navigating to the site's Settings > General page in the Tableau Server web interface and unchecking the option "Enable table recommendations." This prevents users on that site from seeing these suggestions, offering a straightforward UI-based solution.

Option B (Use the command: `tsm configuration set -k recommendations.enabled -v false`): Incorrect. There is no `recommendations.enabled` key in the TSM configuration settings. This feature is managed per site, not server-wide via TSM.

Option C (Publish data sources only to projects with permissions locked): Incorrect. Locking permissions restricts access but doesn't disable the recommendation feature itself. Users with access would still see recommendations.

Option D (Disable the option using the server Settings page): Incorrect. Table recommendations are a site-specific setting, not a server-wide setting. The server Settings page (via TSM) controls global configurations, not this feature.

Reference: Tableau Server Documentation - "Manage Site Settings" (https://help.tableau.com/current/server/en-us/site_settings.htm).

NEW QUESTION # 25

What should you use to set a preferred active repository?

- A. The TSM browser client's Configuration Topology page
- B. The TSM browser client's Maintenance page
- C. A `tsm configuration set` command
- D. A `tabcmd` set command

Answer: C

Explanation:

Tableau Server uses a PostgreSQL database as its repository to store metadata, user information, and permissions. In a high-availability (HA) setup with multiple nodes, there are typically two repository instances: one active and one passive. The "preferred active repository" refers to designating which repository instance should take priority as the active one. This is managed through Tableau Services Manager (TSM).

The correct method to set the preferred active repository is by using the `tsm configuration set` command.

Specifically, you would use a command like:

```
tsm configuration set -k postgresql.preferred_host -v <hostname>
```

This command allows an administrator to specify the preferred host for the active repository, ensuring control over which node takes precedence in an HA environment.

Option B (`tabcmd` set command) is incorrect because `tabcmd` is a command-line utility primarily used for administrative tasks like managing users, groups, and content (e.g., publishing workbooks), not for configuring server topology or repository settings.

Option C (TSM browser client's Maintenance page) is incorrect because the Maintenance page in the TSM web interface is used for tasks like backups, restores, and cleanup, but it does not provide an option to set the preferred active repository.

Option D (TSM browser client's Configuration Topology page) is partially relevant since the Topology page displays the current configuration of services across nodes, including the repository. However, it does not allow direct modification of the preferred active repository; this must be done via the `tsm` command line.

Reference: Tableau Server Documentation - "Configure Tableau Server Repository" (<https://help.tableau.com/current/server/en-us/repository.htm>) and "TSM Command Line Reference" (https://help.tableau.com/current/server/en-us/cli_configuration_set.htm).

NEW QUESTION # 26

What are two features of the Tableau Server user-based license? (Choose two.)

- A. A subscription license
- B. Restricts the number of machine cores you can deploy
- C. A perpetual license
- D. Enables distinct user roles

Answer: A,D

Explanation:

Tableau Server's user-based licensing model assigns licenses to individual users (Creator, Explorer, Viewer) rather than machines or cores. Key features include:

* Subscription license: Licenses are typically subscription-based, renewed annually or monthly, aligning with Tableau's pricing model.

* Distinct user roles: It supports three roles (Creator, Explorer, Viewer), each with specific capabilities, enabling granular access

control.

- * Option A (A subscription license): Correct. User-based licenses are subscription-based by default.
- * Option B (Enables distinct user roles): Correct. The model defines Creator, Explorer, and Viewer roles.
- * Option C (Restricts the number of machine cores): Incorrect. This applies to core-based licensing, not user-based.
- * Option D (A perpetual license): Incorrect. Perpetual licenses were phased out; user-based licenses are subscription-based as of recent models.

Reference: Tableau Server Documentation - "Licensing Overview" (https://help.tableau.com/current/server/en-us/license_usage.htm).

NEW QUESTION # 27

What are two intervals when Tableau Server verifies if data conditions for data-driven alerts are true? (Choose two.)

- **A. Every 60 minutes**
- B. Whenever a new extract is published
- C. Every 10 minutes
- **D. Whenever extracts in the related workbook are refreshed**

Answer: A,D

Explanation:

Data-driven alerts notify users when data meets conditions (e.g., sales > \$10K). Let's examine when Tableau checks these:

- * Alert Mechanics:
- * Enabled per site (Settings > General > Data-Driven Alerts).
- * Backgrounder evaluates conditions against extract data.
- * Check Intervals: Configurable via tsm configuration set -k dataAlerts.checkIntervalInMinutes (default: 60 minutes).
- * Refresh Trigger: Also checks post-extract refresh for immediate updates.
- * Option A (Every 60 minutes): Correct.
- * Details: Default interval-Backgrounder polls every hour to evaluate alert conditions.
- * Config: Adjustable (e.g., -v 30 for 30 minutes).
- * Option D (Whenever extracts in the related workbook are refreshed): Correct.
- * Details: An extract refresh updates the data, triggering an immediate alert check to catch changes promptly.
- * Why: Ensures timely notifications without waiting for the next poll.
- * Option B (Every 10 minutes): Incorrect.
- * Why: Not the default-possible via config, but not standard.
- * Option C (Whenever a new extract is published): Incorrect.
- * Why: Publishing creates the extract; alerts trigger on refreshes or polling, not initial publication.

Why This Matters: Timing affects alert responsiveness-balancing frequency and server load is key.

Reference: Tableau Server Documentation - "Data-Driven Alerts" (https://help.tableau.com/current/server/en-us/data_alerts.htm).

NEW QUESTION # 28

Which three types of data should you backup to ensure that you can restore a Tableau Server? (Choose three.)

- **A. Configuration data**
- **B. Server secrets and Repository passwords**
- C. Topology data
- **D. Repository data**

Answer: A,B,D

Explanation:

Backing up Tableau Server ensures recovery from failures or migrations. A full backup includes multiple data types-let's dissect this comprehensively:

- * Backup Components:
- * Repository Data: PostgreSQL database with metadata (users, permissions, workbooks). Backed up via tsm maintenance backup -f<filename>.tsbak.
- * Configuration Data: Server settings (e.g., ports, authentication) also in the .tsbak file.
- * Server Secrets: Encryption keys, internal tokens, Repository passwords-critical for restoring functionality.
- * Extracts: .hyper files in File Store (optional, separate backup).
- * Option A (Server secrets and Repository passwords): Correct.

- * Details: Includes encryption keys (for extracts), internal tokens (process communication), and Repository credentials. Backed up separately or stored securely (e.g., tsm security export-keys).
 - * Why Critical: Without these, restored data may be inaccessible or services may fail.
 - * Option C (Configuration data): Correct.
 - * Details: Ports, authentication settings, process topology-part of the .tsbak file.
 - * Why Critical: Restores server behavior and connectivity post-recovery.
 - * Option D (Repository data): Correct.
 - * Details: Core metadata database-also in .tsbak.
 - * Why Critical: Without it, all content and user data is lost.
 - * Option B (Topology data): Incorrect.
 - * Details: Topology (process distribution) is part of configuration data in the .tsbak, not a separate entity. It's not distinctly backed up as "topology data." Why This Matters: A complete backup (secrets, config, repository) ensures full restoration-missing any piece risks an unusable server.
- Reference: Tableau Server Documentation - "Back Up Tableau Server Data" (https://help.tableau.com/current/server/en-us/backup_restore.htm).

NEW QUESTION # 29

.....

What is your dream? Don't you want to make a career? The answer must be ok. Then, you need to upgrade and develop yourself. You worked in the IT industry, through what methods can you realize your dream? Taking IT certification exam and getting the certificate are the way to upgrade yourself. At present, Salesforce Analytics-Admn-201 Exam is very popular. Do you want to get Salesforce Analytics-Admn-201 certificate? If it is ok, don't hesitate to sign up for the exam. And don't worry about how to pass the test, Exams4Collection certification training will be with you.
