WGU Managing Cloud Security (JY02) Sample Questions (Q69-Q74):

NEW QUESTION # 69
A user creates new financial documents that will be stored in the cloud. Which action should the user take before uploading the documents to protect them against threats such as packet capture and on-path attacks?

- A. Hashing
- B. Metadata labeling
- C. Change tracking
- D. Encryption

Answer: D

Explanation:
Before transmitting sensitive financial data to the cloud, the best defense against interception threats like packet capture and man-in-the-middle attacks isencryption. Encryption protects data in transit by converting plain text into cipher text, which can only be deciphered with the correct keys.
Hashing provides integrity verification but does not secure confidentiality. Change tracking monitors modifications but does not prevent interception. Metadata labeling adds context but does not protect against on-path attackers.
Using strong encryption protocols (e.g., TLS) ensures that even if traffic is intercepted, the attacker cannot read the data. Encryption also aligns with compliance requirements such as PCI DSS, which mandates encryption for financial data during transmission. By encrypting before upload, the user ensures end-to-end confidentiality across potentially insecure networks.

NEW QUESTION # 70
An organization is implementing a new hybrid cloud deployment and wants all employees to provide a username, password, and security token before accessing any of the cloud resources. Which type of security control is the organization leveraging for its employees?

- A. Authentication
- B. Authorization
- C. Access control list (ACL)
- D. Web application firewall (WAF)

Answer: A

Explanation:
The requirement for a username, password, and security token describesauthentication-the process of verifying the identity of a user. By requiring multiple factors (something you know + something you have), the organization is implementing multifactor authentication (MFA).
Authorization defines what resources a user can access after authentication. WAFs protect web applications, and ACLs specify rules for allowed or denied traffic, but neither validate user identity.
Authentication ensures that only legitimate users gain access to cloud resources. In hybrid environments, MFA is a strong safeguard against credential theft and phishing attacks, providing assurance that identities are genuine before authorization decisions are made.

NEW QUESTION # 71
Which privacy issue does the Clarifying Lawful Overseas Use of Data (CLOUD) Act address?

- A. Collection and use of genetic information
- B. Conflicting regulations in different jurisdictions
- C. Data breach notification requirements
- D. Use of digital surveillance by multinational employers

Answer: B

Explanation:
TheCLOUD Actaddresses conflicts that arise when law enforcement in one jurisdiction seeks access to data stored in another country. It clarifies how U.S. authorities can compel cloud providers to produce data, even if stored overseas, and establishes a framework for resolving jurisdictional conflicts through bilateral agreements.
The Act does not regulate genetic data, breach notifications, or employer surveillance. Its central purpose is to handle the challenge of cross-border data access in the era of globalized cloud computing.
For organizations, this means carefully evaluating how and where data is stored, and ensuring contracts and compliance strategies account for potential conflicts between U.S. law and foreign privacy regulations like GDPR. Awareness of CLOUD Act obligations is crucial in multinational cloud deployments.

NEW QUESTION # 72
Which U.S. law requires all publicly traded corporations in the United States to provide information about their financial status and implements controls to ensure the accuracy of the disclosed information?

- A. The Gramm-Leach-Bliley Act (GLBA)
- B. The Sarbanes-Oxley (SOX) Act
- C. The Clarifying Lawful Overseas Use of Data (CLOUD) Act
- D. The General Data Protection Regulation (GDPR)

Answer: B

Explanation:
TheSarbanes-Oxley (SOX) Act of 2002was enacted to restore investor confidence after major corporate accounting scandals. It requires publicly traded corporations to maintain accurate financial reporting and implement internal controls to safeguard the integrity of disclosed information.
GLBA focuses on protecting consumer financial data, GDPR is a European regulation governing privacy, and the CLOUD Act addresses cross-border law enforcement access to data. Only SOX directly mandates financial disclosure and corporate accountability.
SOX compliance includes maintaining audit trails, securing data integrity, and ensuring that executives certify financial statements. Failure to comply carries severe penalties, both civil and criminal. For cloud environments, SOX compliance extends to ensuring IT systems used for financial data are secure, monitored, and auditable.

NEW QUESTION # 73
An organization wants to secure the boundary between a lower-security zone and a higher-security zone.
Which security measure should it use?

- A. Bastion host
- B. Virtual client
- C. Host isolation
- D. Secure Shell

Answer: A

Explanation:
Abastion hostis a hardened system placed at the boundary between different security zones. It acts as a gateway, controlling access from a less secure network (such as the internet or a lower-trust zone) into a higher-security zone (such as an internal cloud environment).
Secure Shell (SSH) provides secure communication but does not create a boundary. Virtual clients and host isolation are endpoint measures, not boundary defenses.
By placing a bastion host at the perimeter, organizations centralize monitoring, apply strict access controls, and reduce attack surfaces. These hosts are typically stripped down to essential services, patched frequently, and monitored closely. In cloud environments, bastion hosts are essential for controlling administrative access while enforcing strong authentication and logging.
