Amazon AWS Certified SysOps Administrator - Associate (SOA-C02) Sample Questions (Q382-Q387):

NEW QUESTION # 382

A Sysops administrator recently configured Amazon S3 Cross-Region Replication on an S3 bucket Which of the following does this feature replicate to the destination S3 bucket by default?

- A. Objects in the source S3 bucket for which the bucket owner does not have permissions
- B. Objects that existed before replication was configured
- C. Objects that are stored in S3 Glacier
- D. Object metadata

Answer: D

Explanation:

Amazon S3 Cross-Region Replication (CRR) is a feature that automatically replicates objects across AWS regions. When CRR is configured, certain aspects are replicated by default, and some are not. Here are the details:

- * Objects in the source S3 bucket for which the bucket owner does not have permissions: CRR does not replicate objects for which the bucket owner does not have permissions.
- * Objects that are stored in S3 Glacier: Objects in the S3 Glacier storage class are not replicated by CRR.
- * Objects that existed before replication was configured: Only objects created or modified after the replication configuration will be replicated. Objects that existed before the configuration are not replicated by default.
- * Object metadata: CRR replicates the object metadata along with the object to ensure that the replica in the destination bucket is as accurate as possible.

NEW QUESTION # 383

A company hosts its website on Amazon EC2 instances behind an Application Load Balancer. The company manages its DNS with Amazon Route 53, and wants to point its domain's zone apex to the website.

Which type of record should be used to meet these requirements?

- A. An alias record for the domain's zone apex
- B. A CNAME record for the domain's zone apex
- C. An AAAA record for the domain's zone apex
- D. An A record for the domain's zone apex

Answer: A

NEW QUESTION # 384

A SysOps administrator noticed that the cache hit ratio for an Amazon CloudFront distribution is less than 10%.

Which collection of configuration changes will increase the cache hit ratio for the distribution? (Select TWO.)

- A. Change the Viewer Protocol Policy to use HTTPS only.
- B. Configure the distribution to use presigned cookies and URLs to restrict access to the distribution.
- C. Ensure that only required cookies, query strings, and headers are forwarded in the Cache Behavior Settings.
- D. Enable automatic compression of objects in the Cache Behavior Settings.
- E. Increase the CloudFront time to live (TTL) settings in the Cache Behavior Settings.

Answer: C,E

Explanation:

To increase the cache hit ratio for an Amazon CloudFront distribution, you can make several adjustments to its configuration:

- * Minimize Forwarding of Cookies, Query Strings, and Headers:
- * By default, CloudFront caches based on URL, but if it forwards headers, cookies, and query strings to the origin, it can decrease the cache hit ratio.
- * Navigate to your CloudFront distribution in the AWS Management Console.
- * In the Behaviors tab, edit the cache behavior.
- * Set the option to forward only the necessary cookies, query strings, and headers. This reduces the variations of objects stored in the cache.
- * Increase Time to Live (TTL) Settings:
- * Increasing the TTL allows objects to stay in the cache for a longer period, reducing the frequency of fetching data from the origin.
- * In the same Behaviors tab, adjust the Minimum TTL, Maximum TTL, and Default TTL settings to higher values. This ensures that content remains cached for a longer duration before it needs to be fetched again from the origin.

NEW QUESTION # 385

A company that uses AWS Organizations has an organization that contains several AWS accounts. A SysOps administrator needs to implement controls to prevent an account from leaving the organization.

Which solution will meet these requirements?

- A. Create a service control policy (SCP) that denies the RemoveAccountFromOrganization action. Apply the SCP to the root organizational unit (OU).
- B. Deploy an AWS Lambda function in each member account to remove any Organizations permissions when a user is created.
- **C. Create a service control policy (SCP) that denies the LeaveOrganization action. Apply the SCP to the root organizational unit (OU).**
- D. Turn on AWS Config. Set up the account-part-of-organizations managed rule. Configure the rule to run every hour.

Answer: C

Explanation:

To prevent an account from leaving an AWS Organization, you use an SCP to deny the organizations:

LeaveOrganization action.

From AWS Organizations documentation:

You can use a deny statement on organizations:LeaveOrganization to prevent accounts from leaving your AWS Organization.

NEW QUESTION # 386

A SysOps administrator must create an IAM policy for a developer who needs access to specific AWS services. Based on the requirements, the SysOps administrator creates the following policy:

Which actions does this policy allow? (Select TWO.)

- **A. Describe AWS load balancers.**
- B. Delete an Amazon Simple Queue Service (Amazon SQS) queue.
- **C. Invoke an AWS Lambda function.**
- D. Create an IAM role for an AWS Lambda function.
- E. Create an AWS Storage Gateway.

Answer: A,C

Explanation:

The provided IAM policy grants the following permissions:

* Describe AWS Load Balancers:

* The policy allows actions with the prefix elasticloadbalancing:. This includes actions like DescribeLoadBalancers and other Describe* actions related to Elastic Load Balancing.

Reference: Elastic Load Balancing API Actions

Invoke AWS Lambda Function:

The policy allows actions with the prefix lambda:, which includes InvokeFunction and other actions that allow listing and describing Lambda functions.

Reference: AWS Lambda API Actions

The actions related to AWS Storage Gateway (create), IAM role (create), and Amazon SQS (delete) are not allowed by this policy. The policy only grants describe/list permissions for storagegateway, elasticloadbalancing, lambda, and list permissions for SQS.
