Amazon AWS Certified AI Practitioner Sample Questions (Q14-Q19):

NEW QUESTION # 14

A company wants to use a large language model (LLM) on Amazon Bedrock for sentiment analysis. The company wants to know how much information can fit into one prompt.

Which consideration will inform the company's decision?

- A. Context window
- B. Batch size
- C. Temperature
- D. Model size

Answer: A

Explanation:

The context window determines how much information can fit into a single prompt when using a large language model (LLM) like those on Amazon Bedrock.

* Context Window:

* The context window is the maximum amount of text (measured in tokens) that a language model can process in a single pass.

* For LLM applications, the size of the context window limits how much input data, such as text for sentiment analysis, can be fed into the model at once.

* Why Option B is Correct:

* Determines Prompt Size: The context window size directly informs how much information (e.g., words or sentences) can fit in one prompt.

* Model Capacity: The larger the context window, the more information the model can consider for generating outputs.

* Why Other Options are Incorrect:

* A. Temperature: Controls randomness in model outputs but does not affect the prompt size.

* C. Batch size: Refers to the number of training samples processed in one iteration, not the amount of information in a prompt.

* D. Model size: Refers to the number of parameters in the model, not the input size for a single prompt.

NEW QUESTION # 15

A company wants to generate synthetic data responses for multiple prompts from a large volume of data. The company wants to use an API method to generate the responses. The company does not need to generate the responses immediately.

- A. Use Amazon Bedrock batch inference. Generate responses asynchronously.
- B. Use AWS Lambda functions to automate the task. Submit one prompt after another and store each response.
- C. Use Amazon Bedrock agents. Build an agent system to process the prompts recursively.
- D. Input the prompts into the model. Generate responses by using real-time inference.

Answer: A

NEW QUESTION # 16

Which AWS service helps select foundation models (FMs) for generative AI use cases?

- A. Amazon Rekognition
- B. Amazon Q Developer
- C. Amazon Personalize
- D. Amazon Bedrock

Answer: D

Explanation:

Comprehensive and Detailed Explanation From Exact AWS AI documents:

Amazon Bedrock provides access to multiple foundation models from different providers and enables customers to evaluate, compare, and select the most appropriate model for their generative AI use cases.

Amazon Bedrock:

- * Offers a choice of foundation models
 - * Supports model evaluation and customization
 - * Abstracts infrastructure management
- Why the other options are incorrect:
- * Amazon Personalize (A) is a recommendation service.
 - * Amazon Q Developer (C) is a coding assistant.
 - * Amazon Rekognition (D) is an image and video analysis service.
- AWS AI document references:
- * Amazon Bedrock Overview
 - * Choosing Foundation Models on AWS

NEW QUESTION # 17

Sentiment analysis is a subset of which broader field of AI?

- A. Time series forecasting
- **B. Natural language processing (NLP)**
- C. Computer vision
- D. Robotics

Answer: B

Explanation:

- * Sentiment analysis is the task of determining the emotional tone or intent behind a body of text (positive, negative, neutral).
- * This falls under Natural Language Processing (NLP) because it deals with understanding and processing human language.
- * Computer vision relates to images, robotics to autonomous machines, and time series forecasting to predicting values from sequential data.

NEW QUESTION # 18

An airline company wants to build a conversational AI assistant to answer customer questions about flight schedules, booking, and payments. The company wants to use large language models (LLMs) and a knowledge base to create a text-based chatbot interface.

Which solution will meet these requirements with the LEAST development effort?

- **A. Develop a Retrieval Augmented Generation (RAG) agent by using Amazon Bedrock.**
- B. Create a Python application by using Amazon Q Developer.
- C. Train models on Amazon SageMaker Autopilot.
- D. Fine-tune models on Amazon SageMaker Jumpstart.

Answer: A

Explanation:

The airline company aims to build a conversational AI assistant using large language models (LLMs) and a knowledge base to create a text-based chatbot with minimal development effort. Retrieval Augmented Generation (RAG) on Amazon Bedrock is an ideal solution because it combines LLMs with a knowledge base to provide accurate, contextually relevant responses without requiring extensive model training or custom development. RAG retrieves relevant information from a knowledge base and uses an LLM to generate responses, simplifying the development process.

Exact Extract from AWS AI Documents:

From the AWS Bedrock User Guide:

"Retrieval Augmented Generation (RAG) in Amazon Bedrock enables developers to build conversational AI applications by combining foundation models with external knowledge bases. This approach minimizes development effort by leveraging pre-trained models and integrating them with data sources, such as FAQs or databases, to provide accurate and contextually relevant responses." (Source: AWS Bedrock User Guide, Retrieval Augmented Generation) Detailed Explanation:

Option A: Train models on Amazon SageMaker Autopilot. SageMaker Autopilot is designed for automated machine learning (AutoML) tasks like classification or regression, not for building conversational AI with LLMs and knowledge bases. It requires significant data preparation and is not optimized for chatbot development, making it less suitable.

Option B: Develop a Retrieval Augmented Generation (RAG) agent by using Amazon Bedrock. This is the correct answer. RAG on

Amazon Bedrock allows the company to use pre-trained LLMs and integrate them with a knowledge base (e.g., flight schedules or FAQs) to build a chatbot with minimal effort. It avoids the need for extensive training or coding, aligning with the requirement for least development effort.

Option C: Create a Python application by using Amazon Q Developer. While Amazon Q Developer can assist with code generation, building a chatbot from scratch in Python requires significant development effort, including integrating LLMs and a knowledge base manually, which is more complex than using RAG on Bedrock.

Option D: Fine-tune models on Amazon SageMaker Jumpstart. Fine-tuning models on SageMaker Jumpstart requires preparing training data and customizing LLMs, which involves more effort than using a pre-built RAG solution on Bedrock. This option is not the least effort-intensive.
