Learning at electronic devices does go against touching the actual study. Although our MuleSoft-Integration-Associate exam dumps have been known as one of the world's leading providers of exam materials, you may be still suspicious of the content. For your convenience, we especially provide several demos for future reference and we promise not to charge you of any fee for those downloading. Therefore, we welcome you to download to try our MuleSoft-Integration-Associate Exam for a small part. Then you will know whether it is suitable for you to use our MuleSoft-Integration-Associate test questions. There are answers and questions provided to give an explicit explanation. We are sure to be at your service if you have any downloading problems.

As we all know, there are many reasons for the failure of the MuleSoft-Integration-Associate exam, such as chance, the degree of knowledge you master. Although the MuleSoft-Integration-Associate exam is an exam to test your mastery of the knowledge of MuleSoft-Integration-Associate, but there are so many factor to influence the result. As long as you choose our MuleSoft-Integration-Associate exam materials, you never have to worry about this problem. Because we will provide you a chance to replace other exam question bank if you didn't pass the MuleSoft-Integration-Associate Exam at once. What's more important it's that also free of charge only if you provide relevant proof. It is very convenient to replace and it's not complicated at all. It will not cause you any trouble.

Salesforce Certified MuleSoft Integration Associate Exam Sample Questions (Q33-Q38):

NEW QUESTION # 33

A developer needs to discover which API specifications have been created within the organization before starting a new project Which Anypoint Platform component can the developer use to find and try out the currently released API specifications?

- A. Anypoint Exchange
- B. Object Store

- C. Runtime Manager
- D. API Manager

Answer: A

Explanation:

When a developer needs to discover which API specifications have been created within the organization before starting a new project, Anypoint Exchange is the component to use. Here's a detailed explanation:

- * Anypoint Exchange:
- * Purpose: Provides a centralized repository where developers can find and access API specifications, connectors, templates, and other reusable assets.
- * API Specifications: Developers can search for API specifications defined using RAML or OAS, review their details, and try them out using provided mock services.
- * Capabilities:
- * Search and Discovery: Easily search for and discover existing API specifications within the organization.
- * Try Out APIs: Provides tools to interact with and test APIs directly from the Exchange, allowing developers to understand the API's functionality and behavior.
- * Documentation: Access detailed documentation and examples for each API specification.

NEW QUESTION # 34

According to MuleSoft a synchronous invocation of a RESTful API using HTTP to get an individual customer record from a single system is an example of which system integration interaction pattern?

- A. Batch
- **B. Request-Reply**
- C. Multicast
- D. One-way

Answer: B

Explanation:

In system integration, different interaction patterns are used depending on the communication requirements between systems. For a synchronous invocation of a RESTful API using HTTP to get an individual customer record from a single system, the Request-Reply pattern is used. Here's a detailed explanation:

- * Request-Reply Pattern:
- * Definition: This pattern involves a client sending a request to a server and waiting for a reply.
- The communication is synchronous, meaning the client waits for the server to process the request and send back the response.
- * Typical Use Case: It is used when immediate feedback is required from the server, such as retrieving a specific customer record.
- * RESTful API and HTTP:
- * Synchronous Communication: HTTP is inherently synchronous, making it suitable for Request-Reply interactions where the client expects an immediate response.
- * Data Retrieval: Commonly used for GET requests in RESTful APIs to retrieve data from a server.
- * Example:
- * Scenario: A client application requests customer details by making a GET request to a RESTful API endpoint. The server processes the request and returns the customer record.

NEW QUESTION # 35

During a planning session with the executive leadership, the development team director presents plans for a new API to expose the data in the company's order database. An earlier effort to build an API on top of this data failed, so the director is recommending a design-first approach.

Which characteristics of a design-first approach will help make this API successful?

- A. Adding global policies to the API so all developers automatically secure the implementation before coding anything

- **B. Developing a specification so consumers can test before the implementation is built**
- C. Building MUnit tests so administrators can confirm code coverage percentage during deployment
- D. Publishing the fully implemented API to Exchange so all developers can reuse the API

Answer: B

Explanation:

A design-first approach emphasizes creating the API specification before implementation, ensuring better alignment with consumer needs and reducing the risk of project failure. Here's a detailed explanation:

* API Specification:

* Definition: An API specification is a detailed, formal description of the API's endpoints, request/response formats, and protocols.

* Consumer Testing: Allows API consumers (developers) to understand, test, and provide feedback on the API design before actual development begins.

* Advantages:

* Early Feedback: Consumers can test the API design using mock services or tools like API Designer and provide feedback, ensuring the API meets their requirements.

* Reduced Rework: Identifies potential issues and design flaws early, reducing costly changes during the implementation phase.

* Documentation: Provides comprehensive documentation that aids in the development and future maintenance of the API.

NEW QUESTION # 36

An application load balancer routes requests to a RESTful web API secured by Anypoint Flex Gateway Which protocol is involved in the communication between the load balancer and the Gateway?

- **A. HTTPS**
- B. SFTP
- C. LDAP
- D. SMTP

Answer: A

Explanation:

In scenarios where an application load balancer routes requests to a RESTful web API secured by Anypoint Flex Gateway, HTTPS is the protocol used. Here's a detailed explanation:

* HTTPS Protocol:

* Definition: HTTPS (HyperText Transfer Protocol Secure) is an extension of HTTP that provides secure communication over a computer network.

* Encryption: It uses SSL/TLS to encrypt the data exchanged between the client and server, ensuring privacy and data integrity.

* Load Balancer to Gateway Communication:

* Secure Communication: The load balancer routes incoming requests to the API Gateway using HTTPS, ensuring that the data is encrypted and secure.

* Standard Practice: HTTPS is the standard protocol for securing API communications, protecting against eavesdropping and man-in-the-middle attacks.

NEW QUESTION # 37

According to MuleSoft what is a major distinguishing characteristic of an application network in relation to the integration of systems, data, and devices?

- **A. It is built for change and self-service**
- B. It uses a well-organized monolithic approach with standards
- C. It leverages well-accepted internet standards like HTTP and JSON
- D. It uses CI/CD automation for real-time project delivery

Answer: A

Explanation:

An application network, as envisioned by MuleSoft, is designed to be dynamic and self-service, enabling rapid adaptation to changing business needs. Here's a detailed explanation:

* Built for Change:

* Flexibility: An application network allows for the easy addition, modification, and removal of services without disrupting existing functionalities.

* Modular Architecture: Promotes a modular approach where services and APIs can be independently developed, deployed, and managed.

* Self-Service:

* Empowerment: Enables different teams (e.g., developers, business units) to access and use APIs and services without heavy reliance on central IT.

* API-led Connectivity: Facilitates a self-service model where reusable APIs are available for various teams to integrate and build upon, accelerating innovation and reducing time-to-market.

* Characteristics:

* Decentralization: Unlike monolithic architectures, an application network supports decentralized development and deployment.

* Reusability and Discoverability: Services and APIs are designed to be easily discoverable and reusable across different parts of the organization.
