Salesforce Analytics-Arch-201 certification exam is a very difficult test. Even if the exam is very hard, many people still choose to sign up for the exam. As to the cause, Analytics-Arch-201 exam is a very important test. For IT staff, not having got the certificate has a bad effect on their job. Salesforce Analytics-Arch-201 certificate will bring you many good helps and also help you get promoted. In a word, this is a test that will bring great influence on your career. Such important exam, you also want to attend the exam.

Salesforce Analytics-Arch-201 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> • Monitor and Maintain a Tableau Deployment: This section evaluates skills of Tableau Administrators in monitoring, maintaining, and optimizing Tableau environments. It involves creating custom administrative dashboards, conducting load testing using tools like TabJolt, and analyzing test results. Troubleshooting complex performance bottlenecks in workbooks and server resources is key, as is tuning caching and scaling strategies. It covers leveraging observability tools such as the Resource Monitoring Tool, analyzing logs and metrics, and adjusting architecture accordingly. Automation of maintenance functions using APIs, scripting, and scheduling is included, along with managing server extensions, content automation, dashboard extensions, web data connectors, and secure embedded solutions.
Topic 2	<ul style="list-style-type: none"> • Deploy Tableau Server: This domain assesses the ability of Tableau Administrators to perform production-ready deployments of Tableau Server. It encompasses installing and configuring Tableau Server with external components, supporting air-gapped environments, disaster recovery validations, and blue-green deployments. It includes configuring and troubleshooting various authentication methods such as SAML, Kerberos, and LDAP. The section also covers implementing encryption strategies, installing and verifying Tableau Server on Linux and Windows platforms, resolving installation and configuration issues, and managing service accounts and logging.
Topic 3	<ul style="list-style-type: none"> • Design a Tableau Infrastructure: This section of the exam measures skills of Tableau Consultants and focuses on planning and designing a complex Tableau deployment. It covers gathering user requirements, licensing strategies including Authorization-to-Run, high availability and disaster recovery planning, and mapping server add-ons to the organization's needs. It includes planning and implementing Tableau Cloud with Bridge, authentication, user provisioning, and multi-site configuration. Additionally, it addresses migration planning across Tableau products, operating systems, identity stores, and consolidations, as well as designing process topologies, sizing, node roles, and recommending server configurations including security, hardware, and disaster recovery.

Salesforce Analytics-Arch-201 Practical Information & Analytics-Arch-201 Reliable Test Practice

We need fresh things to enrich our life. No one would like to be choked by dull routines. So if you are tired of your job or life, you are advised to try our Analytics-Arch-201 study guide to refresh yourself. It is a wrong idea that learning is useless and dull. We can make promise that you will harvest enough knowledge and happiness from our Analytics-Arch-201 Test Engine. Different from traditional learning methods, our products adopt the latest technology to improve your learning experience. We hope that all candidates can try our free demo before deciding buying our Analytics-Arch-201 practice test. In a word, our study guide is attractive to clients in the market.

Salesforce Certified Tableau Architect Sample Questions (Q24-Q29):

NEW QUESTION # 24

A multinational company is implementing Tableau Cloud and requires a secure method to manage user access across different regions, adhering to various data privacy regulations. What is the most appropriate authentication strategy?

- A. Universal access with a single shared login for all users
- B. Region-specific local authentication for each group of users
- C. Integration with a centralized identity management system that complies with regional data privacy laws
- D. Randomized password generation for each user session

Answer: C

Explanation:

Integration with a centralized identity management system that complies with regional data privacy laws This strategy ensures secure and compliant user access management across different regions by leveraging a centralized system that is designed to meet various data privacy regulations. Option A is incorrect because a single shared login lacks security and does not comply with regional data privacy laws. Option B is incorrect as region-specific local authentication can lead to fragmented and inconsistent access control. Option D is incorrect because randomized password generation for each session, while secure, is impractical and user-unfriendly.

NEW QUESTION # 25

In the process of installing Tableau Server on a Windows system using the Command Line Interface (CLI), what is a critical consideration to ensure the installation proceeds smoothly?

- A. Pre-installing all necessary database drivers on the Windows system
- B. Creating a new Windows user account specifically for the installation of Tableau Server
- C. Temporarily disabling User Account Control (UAC) on the Windows system
- D. Ensuring all command line installation commands are executed with elevated (administrator) privileges

Answer: D

Explanation:

Ensuring all command line installation commands are executed with elevated (administrator) privileges For a smooth installation of Tableau Server on Windows using the CLI, it is essential to ensure that all installation commands are executed with elevated (administrator) privileges. Running commands with administrator rights ensures that the installer has sufficient access to system resources and permissions to install and configure Tableau Server. Option A is incorrect because completely disabling UAC is not recommended and can expose the system to security risks. Option B is incorrect as creating a new Windows user account specifically for the installation is not a standard requirement for installing Tableau Server. Option D is incorrect because pre-installing database drivers, while important for connectivity, is not a direct part of the Tableau Server installation process.

NEW QUESTION # 26

In a Tableau environment utilizing both Tableau Server and Tableau Cloud, what consideration is important when choosing an authentication method?

- A. It should support automatic user provisioning in both Tableau Server and Tableau Cloud

- B. The method must be compatible with Tableau Server's version regardless of its compatibility with Tableau Cloud
- C. The authentication method must allow for different user permissions in Tableau Server and Tableau Cloud
- **D. Ensuring the method allows for the synchronization of user roles and permissions between Tableau Server and Tableau Cloud**

Answer: D

Explanation:

Ensuring the method allows for the synchronization of user roles and permissions between Tableau Server and Tableau Cloud When choosing an authentication method for a Tableau environment that includes both Tableau Server and Tableau Cloud, it is important to ensure that the method allows for synchronization of user roles and permissions between the two platforms. This synchronization is key to maintaining consistent access control and user management across both environments. Option A is incorrect because the requirement for different user permissions in Tableau Server and Tableau Cloud is not a standard consideration for authentication methods. Option B is incorrect as automatic user provisioning is beneficial but not a primary consideration for choosing an authentication method in mixed environments. Option C is incorrect because compatibility with both Tableau Server and Tableau Cloud is important, not just with the version of Tableau Server.

NEW QUESTION # 27

When facing database connectivity issues in a multi-node Tableau Server deployment, which approach is most effective in identifying the root cause?

- **A. Analyzing the server logs on both Tableau Server and the database server to identify any error patterns or connection failures**
- B. Immediately replacing the network switches and routers to ensure more reliable connectivity
- C. Restricting access to the database server to only a few select nodes to reduce load and potential connectivity issues
- D. Migrating all data to a new database server to eliminate the possibility of server-specific connectivity problems

Answer: A

Explanation:

Analyzing the server logs on both Tableau Server and the database server to identify any error patterns or connection failures To effectively identify the root cause of database connectivity issues in a multi-node Tableau Server deployment, analyzing server logs on both the Tableau Server nodes and the database server is crucial. This approach allows for the identification of specific error messages, patterns, or connection failures that can lead to a better understanding of the issue and guide targeted solutions. Option A is incorrect because replacing network hardware immediately is a premature action without first identifying the exact cause of the connectivity issues. Option C is incorrect as restricting access to the database server does not address the underlying cause of the connectivity problems and may limit functionality. Option D is incorrect because migrating to a new database server is a significant undertaking and should be a last resort after other troubleshooting steps have been exhausted.

NEW QUESTION # 28

A company is transitioning to Tableau Cloud but still has critical data in on-premises databases that need to be accessed in real-time. What is the best solution for integrating these data sources with Tableau Cloud?

- A. Migrate all on-premises data to the cloud before using Tableau Cloud
- **B. Implement Tableau Bridge to establish a live connection to on-premises databases**
- C. Rely solely on Tableau Cloud's native capabilities for on-premises data integration
- D. Utilize Tableau Builder for real-time data integration

Answer: B

Explanation:

Implement Tableau Bridge to establish a live connection to on-premises data-bases Tableau Bridge is specifically designed to allow real-time access to on-premises data from Tableau Cloud, making it the ideal solution for this scenario. Option A is incorrect because Tableau Prep Builder is used for data preparation, not for establishing live connections to on-premises data sources. Option C is incorrect as migrating all data to the cloud may not be feasible or desirable for all companies. Option D is incorrect because Tableau Cloud's native capabilities do not include direct live data connections to on-premises databases without Tableau Bridge.

NEW QUESTION # 29

.....

Using actual Salesforce Certified Tableau Architect (Analytics-Arch-201) dumps PDF is the best way to make your spare time useful for the Analytics-Arch-201 test preparation. We also provide you with customizable desktop Salesforce Analytics-Arch-201 practice test software and web-based Salesforce Analytics-Arch-201 Practice Exam. You can adjust timings and Analytics-Arch-201 questions number of our Analytics-Arch-201 practice exams according to your training needs.
