Salesforce Certified Identity and Access Management Architect Sample Questions (Q136-Q141):

NEW QUESTION # 136
Northern Trail Outfitters (NTO) is launching a new sportswear brand on its existing consumer portal built on Salesforce Experience

Cloud. As part of the launch, emails with promotional links will be sent to existing customers to log in and claim a discount. The marketing manager would like the portal dynamically branded so that users will be directed to the brand link they clicked on; otherwise, users will view a recognizable NTO- branded page.

The campaign is launching quickly, so there is no time to procure any additional licenses. However, the development team is available to apply any required changes to the portal.

Which approach should the identity architect recommend?

- A. Configure an additional community site on the same org that is dedicated for the new brand.
- B. Create a full sandbox to replicate the portal site and update the branding accordingly.
- C. Implement Experience ID in the code and extend the URLs and endpoints, as required.
- D. Use Heroku to build the new brand site and embedded login to reuse identities.

Answer: C

Explanation:

To dynamically brand the portal so that users will be directed to the brand link they clicked on, the identity architect should recommend implementing Experience ID in the code and extending the URLs and endpoints, as required. Experience ID is a parameter that can be used to identify different brands or experiences within a single Experience Cloud site (formerly known as Community). Dynamic branding is a feature that allows Experience Cloud sites to display different branding elements, such as logos, colors, or images, based on the Experience ID or other criteria. By implementing Experience ID in the code, the identity architect can provide a consistent and personalized brand experience for each user without creating multiple sites or sandboxes.

NEW QUESTION # 137

A division of a Northern Trail Outfitters (NTO) purchased Salesforce. NTO uses a third party identity provider (IdP) to validate user credentials against Its corporate Lightweight Directory Access Protocol (LDAP) directory. NTO wants to help employees remember as passwords as possible.

What should an identity architect recommend?

- A. Setup Salesforce as an IdP to authenticate against the LDAP directory.
- B. Setup Salesforce as a Service Provider to the existing IdP.
- C. Use Salesforce connect to synchronize LDAP passwords to Salesforce.
- D. Setup Salesforce as an Authentication Provider to the existing IdP.

Answer: B

Explanation:

To help employees remember fewer passwords, an identity architect should recommend setting up Salesforce as a service provider (SP) to the existing IdP. A SP is the system that relies on the IdP for authentication and provides access to its services based on the SAML assertions from the IdP. To set up Salesforce as a SP, you need to create a connected app for Salesforce in the IdP, enable SAML and configure the SAML settings, such as the entity ID, ACS URL, and subject type. You also need to enable SSO for your Salesforce org, upload the IdP certificate, and configure the SSO settings, such as the issuer, identity type, and service provider initiated request binding.

NEW QUESTION # 138

Universal Containers (UC) is using its production org as the identity provider for a new Experience Cloud site and the identity architect is deciding which login experience to use for the site.

Which two page types are valid login page types for the site?
Choose 2 answers

- A. lightning Experience Page
- B. Embedded Login Page
- C. Login Discovery Page
- D. Experience Builder Page

Answer: B,C

NEW QUESTION # 139
Universal Containers (UC) wants to use Salesforce for sales orders and a legacy of system for order fulfillment. The legacy system must update the status of orders in 65* Salesforce in real time as they are fulfilled. UC decides to use OAuth for connecting the legacy system to Salesforce. What OAuth flow should be considered that doesn't require storing credentials, client secret or refresh tokens?

- A. JWT Bearer Token flow
- B. Username-Password flow
- C. Web Server flow
- D. User Agent flow

Answer: A

Explanation:
Explanation
The JWT Bearer Token flow is an OAuth flow in which an external app (also called client or consumer app) sends a signed JSON string to Salesforce called JWT to obtain an access token. The access token can then be used by the external app to read & write data in Salesforce1. This flow does not require storing credentials, client secret or refresh tokens, as the JWT is self-contained and includes information about the app and the user2. The other flows require either user interaction (Web Server flow and User Agent flow) or storing credentials (Username-Password flow)3.

NEW QUESTION # 140
Universal Containers (UC) is looking to purchase a third-party applicationas an Identity Provider. UC is looking to develop a business case for the purchase in general and has enlisted an Architect for advice. Which two capabilities of an Identity Provider should the Architect detail to help strengthen the business case?
Choose2 answers

- A. The Identity Provider can authenticate multiple social media accounts.
- B. The Identity Provider can centralize enterprise password policy.
- C. The Identity provider can store credentials for multiple applications.
- D. The Identity Provider can authenticate multiple applications.

Answer: B,D

Explanation:
The two capabilities of an identity provider that the architect should detail to help strengthen the business case are that the identity provider can authenticate multiple applications and that the identity provider can centralize enterprise password policy. These capabilities can provide benefits such as reducing login friction, improving user experience, enhancing security, and simplifying administration. Option B is not a good choice because the identity provider can authenticate multiple social media accounts may not be relevant for UC's business case, as it does not specify how UC will use social media for its identity management. Option C is not a good choice because the identity provider can store credentials for multiple applications may not be desirable or secure for UC's business case, as it may imply that theidentity provider is using password vaulting or federation rather than single sign-on (SSO) or identity federation.
