CompTIA Cybersecurity Analyst (CySA+) Certification Exam Sample Questions (Q212-Q217):

NEW QUESTION # 212

While reviewing a cyber-risk assessment, an analyst notes there are concerns related to FPGA usage. Which of the following statements would BEST convince the analyst's supervisor to use additional controls?

- A. FPGAs are expensive to produce. Anti-counterfeiting safeguards are needed.**
- B. FPGAs are expensive and can only be programmed once. Code deployment safeguards are needed.
- C. FPGAs have an inflexible architecture. Additional training for developers is needed
- D. FPGAs are vulnerable to malware installation and require additional protections for their codebase.

Answer: A

Explanation:

Ethernet switches are mass-produced and offered at discounts on not so widely-used chips with massive economies of scale. While

in case of FPGAs, they are used as Ethernet switches and hence cost more since the expense of development and infrastructure are distributed among fewer clients.

NEW QUESTION # 213

During the forensic analysis of a compromised machine, a security analyst discovers some binaries that are exhibiting abnormal behaviors. After extracting the strings, the analyst finds unexpected content. Which of the following is the next step the analyst should take?

- A. Validate the binaries' hashes from a trusted source.
- B. Only allow binaries on the approve list to execute.
- C. Use file integrity monitoring to validate the digital signature
- D. Run an antivirus against the binaries to check for malware.

Answer: A

Explanation:

Validating the binaries' hashes from a trusted source is the next step the analyst should take after discovering some binaries that are exhibiting abnormal behaviors and finding unexpected content in their strings. A hash is a fixed-length value that uniquely represents the contents of a file or message. By comparing the hashes of the binaries on the compromised machine with the hashes of the original or legitimate binaries from a trusted source, such as the software vendor or repository, the analyst can determine whether the binaries have been modified or replaced by malicious code. If the hashes do not match, it indicates that the binaries have been tampered with and may contain malware.

NEW QUESTION # 214

A company's application development has been outsourced to a third-party development team. Based on the SLA. The development team must follow industry best practices for secure coding. Which of the following is the BEST way to verify this agreement?

- A. Stress testing
- B. Application fuzzing
- C. Input validation
- D. User acceptance testing
- E. Security regression testing

Answer: B

Explanation:

Explanation

Fuzzing or fuzz testing is a dynamic application security testing technique for negative testing. Fuzzing aims to detect known, unknown, and zero-day vulnerabilities
