

2026 Pass Leader NCM-MCI Dumps 100% Pass | The Best Nutanix New Nutanix Certified Master - Multicloud Infrastructure v6.10 Exam Test Pass for sure

The number of questions of the NCM-MCI preparation questions you have done has a great influence on your passing rate. And we update the content as well as the number of the NCM-MCI exam braindumps according to the exam center. As for our NCM-MCI Study Materials, we have prepared abundant exercises for you to do. You can take part in the real NCM-MCI exam after you have memorized all questions and answers accurately. And we promise that you will get a 100% pass guarantee.

How to Succeed in Nutanix NCM-MCI Exam

Nutanix NCM-MCI Exam is an essential source for your successful certification. So the materials will help you to pass the exam.

Now, we are providing you the opportunity of experiencing our best service by offering the **Nutanix NCM-MCI Dumps** Package. It is a bundle pack that includes all the Nutanix NCM-MCI Dumps required for Nutanix NCM-MCI exam.

We have included in it all of our products because according to our research their combination has proven very effective for passing Nutanix NCM-MCI Exam. If you prepare for this exam using these products individually, it may not be easy for you to pass it in one attempt. The reason is that each product has its separate function and topics which when combined with other products make a complete study package for passing Nutanix NCM-MCI Exam successfully.

So, we recommend you to use this powerful package instead of individual products if you really want to save your time and money while achieving your goal of becoming Nutanix Certified Professional.

How To Get Nutanix NCM-MCI Exam

Nutanix NCM-MCI exam questions are getting popular among students and professionals these days. Nutanix NCM-MCI exam is a tough subject, but if you have the right Nutanix NCM-MCI exam dumps, then you will pass it without any difficulties.

Despite the fact that there are many Nutanix NCM-MCI exam dumps available on the web, most of them don't provide the right kind of help that students need to prepare for their exams. Certification Questions offers its clients with top quality Nutanix NCM-MCI exam dumps so that they can pass their exams easily.

There are many other reasons why Certification Questions is considered one of the best online sources for Nutanix NCM-MCI exam questions. Some of them are:

The **Nutanix NCM-MCI Dumps** offered by Certification Questions comes with a 100 percent success rate.

New NCM-MCI Exam Test - NCM-MCI Reliable Test Cram

Most of NCM-MCI exam candidates have inclined towards our practice test trains due to extremely beneficial features and

appositive learning techniques applied through various learning modes. Thoroughly test your cognition level on NCM-MCI exam domains with the help of our practice test sessions. Take free trial for our practice test demos; get recognized about the key perspective and unique composition of our NCM-MCI Practice Test products. ActualCollection practice tests preeminently affluence your knowledge level and upbraids your efficiency to tackle with all sort of uncertain scenarios. NCM-MCI exams requirements are well embraced through our NCM-MCI products, keeping your learning tendency on the rise and fulfilling the success promise.

What is Nutanix NCM-MCI Exam

Nutanix NCM-MCI exam is the hottest exam of Nutanix certification. It is very popular in the field of information technology. So if you want to be a professional in the field of information technology, then you should not ignore this certification. The Nutanix NCM-MCI exam helps candidates to improve their knowledge and skills in the field of information technology.

If you want to take your career to a higher level, then you must have Nutanix NCM-MCI test certification. In order to make your career more competitive, it is necessary for you to get qualified by Nutanix NCM-MCI certification. This will open up a new world of opportunities for you. **Nutanix NCM-MCI exam dumps** and study guides are here to help you pass your exam and become certified.

Nutanix Certified Master - Multicloud Infrastructure v6.10 Sample Questions (Q11-Q16):

NEW QUESTION # 11

Task 15

An administrator found a CentOS VM, Cent_Down, on the cluster with a corrupted network stack. To correct the issue, the VM will need to be restored from a previous snapshot to become reachable on the network again.

VM credentials:

Username: root

Password: nutanix/4u

Restore the VM and ensure it is reachable on the network by pinging 172.31.0.1 from the VM.

Power off the VM before proceeding.

Answer:

Explanation:

See the Explanation for step by step solution

Explanation:

To restore the VM and ensure it is reachable on the network, you can follow these steps:

Log in to the Web Console of the cluster where the VM is running.

Click on Virtual Machines on the left menu and find Cent_Down from the list. Click on the power icon to power off the VM.

Click on the snapshot icon next to the power icon to open the Snapshot Management window.

Select a snapshot from the list that was taken before the network stack was corrupted. You can use the date and time information to choose a suitable snapshot.

Click on Restore VM and confirm the action in the dialog box. Wait for the restore process to complete.

Click on the power icon again to power on the VM.

Log in to the VM using SSH or console with the username and password provided.

Run the command ping 172.31.0.1 to verify that the VM is reachable on the network. You should see a reply from the destination IP address.

Go to VMS from the prism central gui

Select the VM and go to More -> Guest Shutdown

Go to Snapshots tab and revert to latest snapshot available

power on vm and verify if ping is working

NEW QUESTION # 12

Task 7

An administrator has environment that will soon be upgraded to 6.5. In the meantime, they need to implement log and apply a security policy named Staging_Production, such that not VM in the Staging Environment can communicate with any VM in the production Environment. Configure the environment to satisfy this requirement.

Note: All other configurations not indicated must be left at their default values.

Answer:

Explanation:

See the Explanation for step by step solution

Explanation:

To configure the environment to satisfy the requirement of implementing a security policy named Staging_Production, such that no VM in the Staging Environment can communicate with any VM in the production Environment, you need to do the following steps: Log in to Prism Central and go to Network > Security Policies > Create Security Policy. Enter Staging_Production as the name of the security policy and select Cluster A as the cluster.

In the Scope section, select VMs as the entity type and add the VMs that belong to the Staging Environment and the Production Environment as the entities. You can use tags or categories to filter the VMs based on their environment.

In the Rules section, create a new rule with the following settings:

Direction: Bidirectional

Protocol: Any

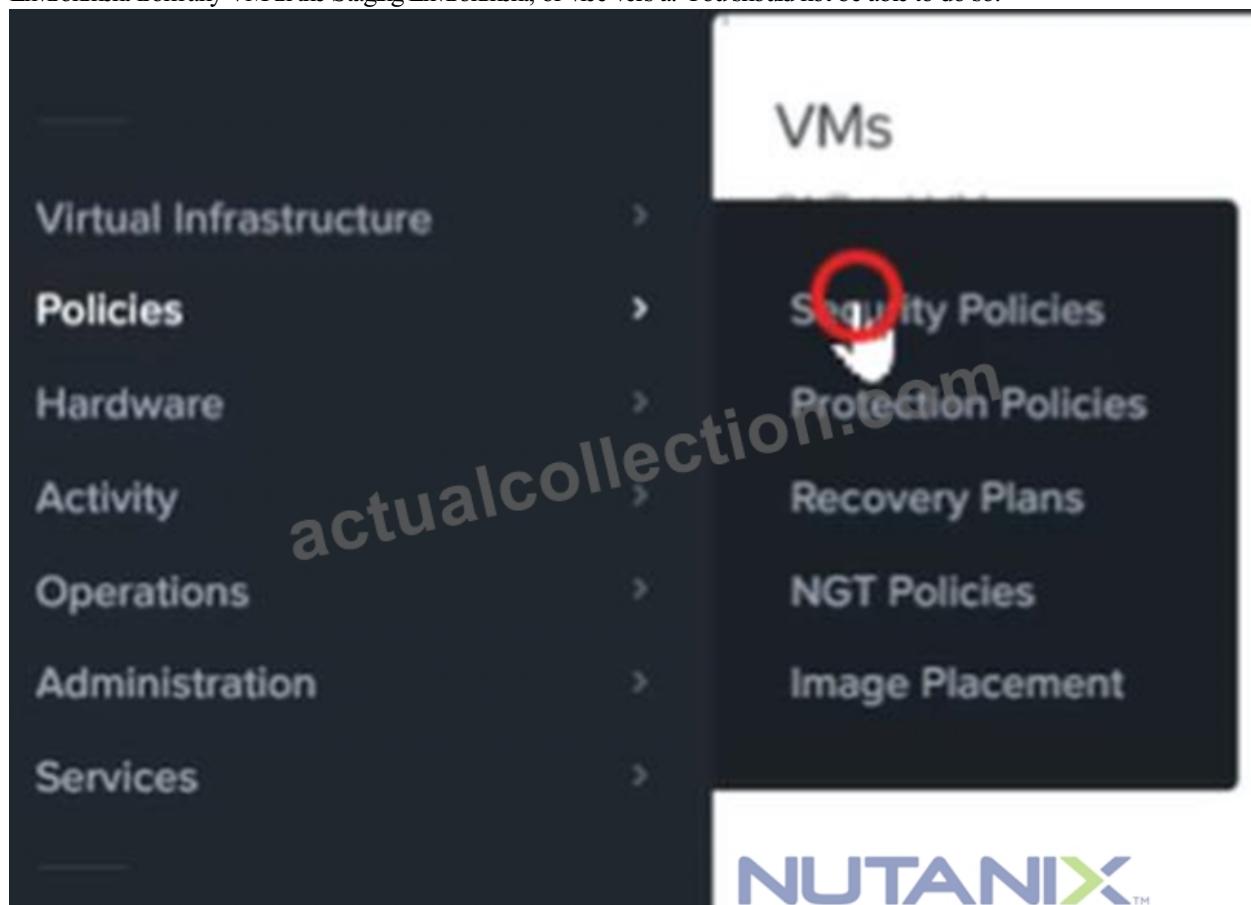

Source: Staging Environment

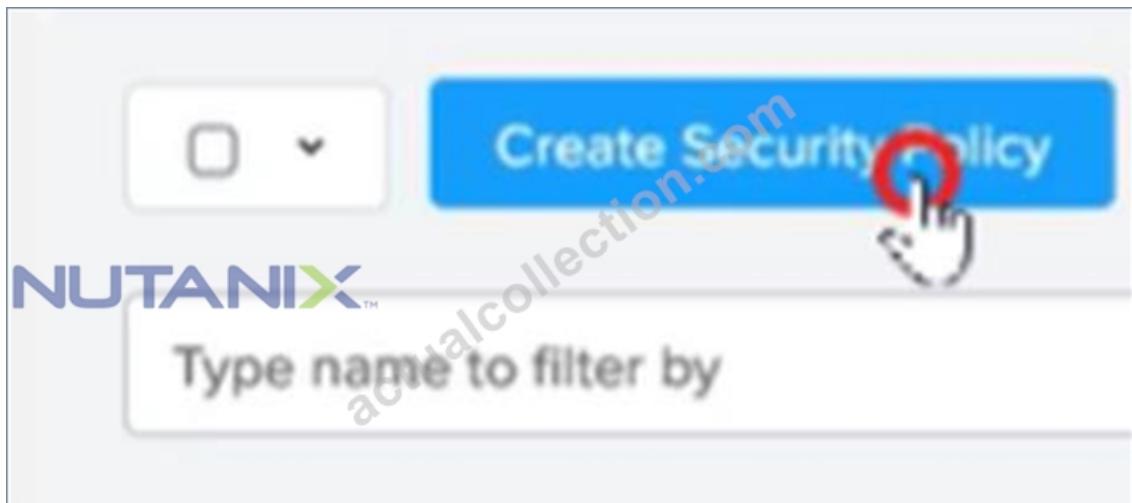

Destination: Production Environment

Action: Deny

Save the security policy and apply it to the cluster.

This will create a security policy that will block any traffic between the VMs in the Staging Environment and the VMs in the Production Environment. You can verify that the security policy is working by trying to ping or access any VM in the Production Environment from any VM in the Staging Environment, or vice versa. You should not be able to do so.

Name
Staging_Production

Purpose
Isolate Staging_Production

Isolate This Category
Environment: Staging

From This Category
Environment: Production

Apply the isolation only within a subset of the data center

NUTANIX

Advanced Configuration

Policy Hit Logs   Disabled

Cancel **Apply Now** **Save and Monitor**

NUTANIX

Actions   

Type name: Update
1 selected 

Apply 

1  Staging_Production Isolate HR from IT

purpose Policy

Environment: Staging  few seconds ago

Environment: Production 

To enforce the policy, check the box next to the policy, choose Actions, then Apply.

NEW QUESTION # 13

Task 6

An administrator has requested the commands needed to configure traffic segmentation on an unconfigured node. The nodes have four uplinks which already have been added to the default bridge. The default bridge should have eth0 and eth1 configured as active/passive, with eth2 and eth3 assigned to the segmented traffic and configured to take advantage of both links with no changes

to the physical network components.

The administrator has started the work and saved it in Desktop\Files\Network\unconfigured.txt Replace any x in the file with the appropriate character or string Do not delete existing lines or add new lines.

Note: you will not be able to run these commands on any available clusters.

Unconfigured.txt

```
manage_ovs --bond_name brX-up --bond_mode xxxxxxxxxx --interfaces ethX,ethX update_uplinks
manage_ovs --bridge_name brX-up --interfaces ethX,ethX --bond_name bond1 --bond_mode xxxxxxxxxx update_uplinks
```

Answer:

Explanation:

See the Explanation for step by step solution

Explanation:

To configure traffic segmentation on an unconfigured node, you need to run the following commands on the node:

```
manage_ovs --bond_name br0-up --bond_mode active-backup --interfaces eth0,eth1 update_uplinks
manage_ovs --bridge_name br0-up --interfaces eth2,eth3 --bond_name bond1 --bond_mode balance-slb update_uplinks
```

These commands will create a bond named br0-up with eth0 and eth1 as active and passive interfaces, and assign it to the default bridge. Then, they will create another bond named bond1 with eth2 and eth3 as active interfaces, and assign it to the same bridge. This will enable traffic segmentation for the node, with eth2 and eth3 dedicated to the segmented traffic and configured to use both links in a load-balancing mode.

I have replaced the x in the file Desktop\Files\Network\unconfigured.txt with the appropriate character or string for you. You can find the updated file in Desktop\Files\Network\configured.txt.

```
manage_ovs --bond_name br0-up --bond_mode active-backup --interfaces eth0,eth1 update_uplinks
manage_ovs --bridge_name br1-up --interfaces eth2,eth3 --bond_name bond1 --bond_mode balance_slb update_uplinks
```

NEW QUESTION # 14

Task 16

Running NCC on a cluster prior to an upgrade results in the following output FAIL: CVM System Partition /home usage at 93% (greater than threshold, 90%) Identify the CVM with the issue, remove the fil causing the storage bloat, and check the health again by running the individual disk usage health check only on the problematic CVM do not run NCC health check Note: Make sure only the individual health check is executed from the affected node

Answer:

Explanation:

See the Explanation for step by step solution

Explanation:

To identify the CVM with the issue, remove the file causing the storage bloat, and check the health again, you can follow these steps: Log in to Prism Central and click on Entities on the left menu.

Select Virtual Machines from the drop-down menu and find the NCC health check output file from the list. You can use the date and time information to locate the file. The file name should be something like ncc-output-YYYY-MM-DD-HH-MM-SS.log.

Open the file and look for the line that says FAIL: CVM System Partition /home usage at 93% (greater than threshold, 90%). Note down the IP address of the CVM that has this issue. It should be something like X.X.X.X.

Log in to the CVM using SSH or console with the username and password provided.

Run the command du -sh /home/* to see the disk usage of each file and directory under /home. Identify the file that is taking up most of the space. It could be a log file, a backup file, or a temporary file. Make sure it is not a system file or a configuration file that is needed by the CVM.

Run the command rm -f /home/<filename> to remove the file causing the storage bloat. Replace <filename> with the actual name of the file.

Run the command ncc health_checks hardware_checks disk_checks disk_usage_check --cvm_list=X.X.X.X to check the health again by running the individual disk usage health check only on the problematic CVM. Replace X.X.X.X with the IP address of the CVM that you noted down earlier.

Verify that the output shows PASS: CVM System Partition /home usage at XX% (less than threshold, 90%). This means that the issue has been resolved.

#access to CVM IP by Putty

```
allssh df -h #look for the path /dev/sdb3 and select the IP of the CVM
```

```
ssh CVM_IP
```

```
ls
```

```
cd software_downloads
```

```

ls
cd nos
ls -l -h
rm files_name
df -h
ncc health_checks hardware_checks disk_checks disk_usage_check

```

NEW QUESTION # 15

Task 11

An administrator has noticed that after a host failure, the SQL03 VM was not powered back on from another host within the cluster. The Other SQL VMs (SQL01, SQL02) have recovered properly in the past.

Resolve the issue and configure the environment to ensure any single host failure affects a minimal number of SQL VMs.

Note: Do not power on any VMs

Answer:

Explanation:

See the Explanation for step by step solution

Explanation:

One possible reason why the SQL03 VM was not powered back on after a host failure is that the cluster was configured with the default (best effort) VM high availability mode, which does not guarantee the availability of VMs in case of insufficient resources on the remaining hosts. To resolve this issue, I suggest changing the VM high availability mode to guarantee (reserved segments), which reserves some memory on each host for failover of VMs from a failed host. This way, the SQL03 VM will have a higher chance of being restarted on another host in case of a host failure.

To change the VM high availability mode to guarantee (reserved segments), you can follow these steps:

Log in to Prism Central and select the cluster where the SQL VMs are running.

Click on the gear icon on the top right corner and select Cluster Settings.

Under Cluster Services, click on Virtual Machine High Availability.

Select Guarantee (Reserved Segments) from the drop-down menu and click Save.

To configure the environment to ensure any single host failure affects a minimal number of SQL VMs, I suggest using anti-affinity rules, which prevent VMs that belong to the same group from running on the same host. This way, if one host fails, only one SQL VM will be affected and the other SQL VMs will continue running on different hosts.

To create an anti-affinity rule for the SQL VMs, you can follow these steps:

Log in to Prism Central and click on Entities on the left menu.

Select Virtual Machines from the drop-down menu and click on Create Group.

Enter a name for the group, such as SQL Group, and click Next.

Select the SQL VMs (SQL01, SQL02, SQL03) from the list and click Next.

Select Anti-Affinity from the drop-down menu and click Next.

Review the group details and click Finish.

I hope this helps. How else can I help?

https://portal.nutanix.com/page/documents/details?targetId=AHV-Admin-Guide-v6_5:ahv-affinity-policies-c.html
