質問 #37

A user is crafting a prompt and includes both the goal and the context within the text of the prompt. What is a benefit of crafting the prompt in this way?

- A. Faster rate of response
- **B. Greater interaction effectiveness**
- C. Improved interface appeal
- D. Reduced computational load

正解: B

解説:

Combining a clear goal with rich context is the gold standard for achieving greater interaction effectiveness.

The goal tells the AI what to achieve (the destination), while the context explains the circumstances surrounding the task (the map).

When these two elements are present, the AI can generate a response that is not only factually correct but also relevant to the user's specific situation. Effectiveness in AI interactions is measured by how closely the output meets the user's needs on the first try.

When a prompt lacks a goal, the AI might provide a great summary of a topic but fail to perform the required action. When it lacks context, it might perform the action in a way that is inappropriate for the audience. By merging them, the user minimizes "drift"-the tendency for AI to wander into irrelevant topics. This leads to a more professional, tailored, and high-quality interaction. In practical scenarios, such as drafting a corporate policy or creating a marketing strategy, the synergy between goal and context ensures that the AI understands the "big picture," resulting in a much more effective and usable first draft.

A lawyer needs to interact with a database to search for cases relating to college admissions. What is a benefit of writing effective prompts when interacting with the database?

- A. Data modification for improved applicability
- B. Greater capacity for unstructured data storage
- C. Automatic expansion to include more data
- **D. Prevention of sifting through irrelevant results**

正解: D

解説:

For professionals dealing with vast amounts of specialized information, such as lawyers, the primary benefit of effective prompt engineering is the prevention of sifting through irrelevant results. Legal databases are massive, containing millions of precedents, statutes, and opinions. A vague prompt like "Find cases about schools" would return thousands of results, most of which would be useless to a specific case regarding college admissions.

By using specific keywords, Boolean logic, and contextual constraints within the prompt (e.g., "Search for U.

S. Supreme Court cases from 2000-2023 specifically addressing affirmative action in private university undergraduate admissions"), the lawyer drastically narrows the search field. This precision is the essence of effective prompting in a professional environment. It saves significant time and cognitive energy by ensuring that the AI or search algorithm acts as a high-resolution filter. This "signal-to-noise" optimization allows the professional to focus on the high-value task of legal analysis rather than the low-value task of manual data sorting. Effective prompts turn a mountain of data into a curated list of relevant evidence.

質問 # 39

What is an advantage of using Personas in prompt engineering?

- A. Greater response speed
- B. Better memory of past conversations
- C. Efficient use of system memory
- **D. Highly relevant responses**

正解: D

解説:

The primary advantage of using a persona (e.g., "Act as a senior data scientist" or "You are a friendly high school tutor") is the generation of highly relevant responses. A persona acts as a sophisticated filter for the AI's vast training data. When a persona is assigned, the model narrows its focus to the tone, vocabulary, and problem-solving frameworks that are most characteristic of that specific role. This ensures that the output is stylistically and substantively aligned with the user's expectations.

For instance, if you ask for financial advice without a persona, you may get a generic list of tips. If you use the persona of a "conservative financial planner for retirees," the response will prioritize low-risk investments and capital preservation. This relevance is key to professional applications where the "voice" of the output is just as important as the information itself. Personas essentially

prime the model's "associative memory" to pull from the most appropriate clusters of data, making the interaction feel more like a consultation with an expert rather than a search query.

質問 # 40

What is the principle of ethics that is ensured by creating mechanisms to assign responsibility for AI actions and decisions?

- A. Societal impact
- **B. Accountability**
- C. Transparency
- D. Fairness

正解: B

解説:

The principle of Accountability is centered on the requirement that there must be an identifiable person or entity responsible for the outcomes of an AI system's actions. As AI systems become more autonomous, the "responsibility gap" becomes a significant ethical risk. Establishing accountability means creating clear frameworks—legal, organizational, and technical—to ensure that when an AI makes a mistake (such as an incorrect medical diagnosis or a biased financial decision), there is a mechanism for recourse, explanation, and correction.

In the context of prompt engineering, accountability is often managed through "human-in-the-loop" systems.

This ensures that while the AI may generate the initial draft or decision-making logic, a human remains the ultimate authority who "signs off" on the result. Accountability also involves "Auditability"—the ability for third parties to review the AI's logs and decision-making history. Without accountability, AI deployment can lead to "organized irresponsibility," where no one takes ownership of systemic failures. By embedding accountability into the lifecycle of an AI project, organizations protect themselves and their users, ensuring that the technology serves as a tool for human progress rather than an unchecked black box.

質問 # 41

A company is developing a customer service chatbot and wants the response to be limited to a specific number of characters because the chatbot is meant to operate through text. What is the focus of this scenario?

- A. Verbosity
- **B. Constraints**
- C. Tone
- D. Output format

正解: B

解説:

This scenario describes the application of Constraints within a prompt. Constraints are the specific boundaries, limitations, or "rules" that the AI must follow when generating a response. In this instance, the constraint is the character limit. Because the chatbot operates via text (likely SMS or a narrow chat window), long-form responses would be technically or practically problematic. By setting a character limit, the prompt engineer is forcing the AI to prioritize brevity and essential information.

Constraints are vital in professional AI applications to ensure that the output is "fit for purpose." They go beyond the general "Output format" (which might just specify "a list" or "an email") by providing hard logical or physical parameters. Other common constraints include "do not use jargon," "avoid mentioning competitors," or "write at a fifth-grade reading level." In the development of customer service bots, constraints help maintain a consistent user experience and ensure that the AI's behavior aligns with the technical requirements of the platform. Managing constraints effectively is one of the most important skills in prompt engineering, as it prevents the AI from becoming too wordy (verbosity) or wandering off-topic.
