

100% Pass Quiz 2026 Juniper Professional JN0-364: Service Provider Routing and Switching, Specialist (JNCIS-SP) Exam Passing Score

BTW, DOWNLOAD part of ValidExam JN0-364 dumps from Cloud Storage: <https://drive.google.com/open?id=1HiekB85GIZxVFefTGJHwxlfegOB5wTIM>

The Juniper JN0-364 questions certificates are the most sought-after qualifications for those looking to further their careers in the business. To get the Juniper JN0-364 exam questions credential, candidates must pass the Juniper JN0-364 exam. But what should you do if you want to pass the Juniper Service Provider Routing and Switching, Specialist (JNCIS-SP) exam questions the first time? Fortunately, ValidExam provides its users with the most recent and accurate Juniper JN0-364 Questions to assist them in preparing for their real JN0-364 exam. Our Juniper JN0-364 exam dumps and answers have been verified by Juniper certified professionals in the area.

Are you preparing for the JN0-364 test recently? You may have a strong desire to get the JN0-364 exam certification. Now, you may be pleasure, ValidExam JN0-364 can relieve your exam stress. Juniper JN0-364 training camps cover nearly full questions and answers you need, and you can easily acquire the key points, which will contribute to your exam. Besides, Juniper training dumps are edited by senior professional with rich hands-on experience and several years' efforts, and it has reliable accuracy and good application. I think you will pass your exam test with ease by the study of JN0-364 Training Material. What's more, if you buy JN0-364 exam practice cram, you will enjoy one year free update. So you do not worry that the information you get will be out of date, you will keep all your knowledge the latest.

Get Help from Real ValidExam Juniper JN0-364 Exam Questions

We offer a money-back guarantee if you fail despite proper preparation and using our product (conditions are mentioned on our guarantee page). This feature gives you the peace of mind to confidently prepare for your Service Provider Routing and Switching, Specialist (JNCIS-SP) (JN0-364) certification exam. Our Juniper JN0-364 exam dumps are available for instant download right after purchase, allowing you to start your Service Provider Routing and Switching, Specialist (JNCIS-SP) (JN0-364) preparation immediately.

Juniper Service Provider Routing and Switching, Specialist (JNCIS-SP) Sample Questions (Q176-Q181):

NEW QUESTION # 176

Click the Exhibit button. The routers shown in the exhibit are configured for segment routing. In this scenario, what is the adjacency SID that Router B advertises to Router A?

- A. 0
- B. 1
- C. 10.1.1.2
- D. 10.1.1.1

Answer: A

Explanation:

The diagram you provided shows two routers, Router A and Router B, with MPLS labels between them. In the context of segment routing with MPLS, each router advertises a set of SIDs (Segment Identifiers). These SIDs can be node SIDs, which are associated with the router itself, or adjacency SIDs, which are associated with the links between routers.

Given the information from the exhibit:

Router A has a Router ID of 10.1.1.1 and is associated with the MPLS label 11. Router B has a Router ID of 10.1.1.2 and is associated with the MPLS label 12. The adjacency SID in segment routing is used to identify a specific adjacency between two routers. In this case, the question is asking for the adjacency SID that Router B advertises to Router A. This would be the label that Router B tells Router A to use to send packets directly to Router B over their shared adjacency.

So, the adjacency SID that Router B advertises would be associated with the link that Router A would use to send traffic to Router B, which is labeled with the number 12 in the exhibit.

NEW QUESTION # 177

You are asked to configure interfaces on Juniper devices to support dual VLAN tags. In this scenario, which two interface statements would accomplish this task? (Choose two.)

- A. `vlan-tagging`
- B. `flexible-vlan-tagging`
- C. `gigether-options`
- D. `stacked-vlan-tagging`

Answer: B,D

Explanation:

Flexible VLAN tagging enables an interface to support multiple VLAN tagging formats, including QinQ configurations that use two VLAN tags.

Stacked VLAN tagging enables the interface to process double-tagged Ethernet frames, allowing an outer service VLAN tag to be added to an inner customer VLAN tag for QinQ deployments.

NEW QUESTION # 178

Which two solutions are commonly used to send IPv6 traffic over IPv4 networks? (Choose two.)

- A. VXLAN
- B. NAT6
- C. 6over4
- D. 6to4

Answer: C,D

Explanation:

6to4 is an IPv6 transition mechanism that encapsulates IPv6 packets inside IPv4 packets, allowing IPv6 traffic to traverse an IPv4 network infrastructure.

6over4 is another tunneling mechanism that transports IPv6 packets over an IPv4 network by using IPv4 as the underlying transport, enabling IPv6 communication across IPv4-only networks.

NEW QUESTION # 179

Which term describes the router where traffic enters an MPLS label-switched path (LSP)?

- A. transit router
- **B. ingress router**
- C. penultimate router
- D. egress router

Answer: B

Explanation:

In the architecture of a Label-Switched Path (LSP), routers are categorized based on their role in the handling of a specific packet's lifecycle through the MPLS network. Juniper Networks documentation defines these roles clearly:

The Ingress Router (Option D), also known as the Ingress Label Edge Router (LER), is the entry point of the LSP. Its primary responsibility is to take an incoming "unlabeled" packet (usually a standard IPv4 or IPv6 packet), perform a route lookup, and determine which LSP the packet should follow. Once determined, the Ingress router performs a Push operation, where it encapsulates the packet with an MPLS label header and forwards it toward the next hop. This is where the transition from IP-based forwarding to Label-based switching occurs.

To contrast this with the other options:

- * Transit Router (Option B): These are routers located between the ingress and egress. They perform Swap operations, replacing an incoming label with an outgoing label based on the Label Forwarding Information Base (LFIB).
- * Egress Router (Option A): This is the "tail-end" of the LSP where the packet exits the MPLS domain and the final label is removed (if it hasn't been removed already by the penultimate hop).
- * Penultimate Router (Option C): This is the second-to-last router in the path. As discussed in previous questions, it often performs the Pop operation (Penultimate Hop Popping) to remove the transport label before sending the packet to the Egress LER. Therefore, the router where traffic first "enters" the LSP and receives its initial label is strictly defined as the Ingress router.

NEW QUESTION # 180

Referring to the exhibit, which two statements are correct? (Choose two.)

□

- **A. Prefixes in Level 1 will be redistributed to Level 2.**
- B. Prefixes in Level 2 will be not redistributed to Level 1.
- **C. Prefixes in Level 2 will be redistributed to Level 1.**
- D. Prefixes in Level 1 will not be redistributed to Level 2.

Answer: A,C

Explanation:

In IS-IS, Level 1 routes are usually contained within the same area and Level 2 routes are used to interconnect different areas. By default, routes from Level 1 are redistributed into Level 2, and vice versa, to ensure reachability between areas.

By default, IS-IS protocol leaks routing information from a Level 1 area to a Level 2 area.

However, to leak routing information from a Level 2 area to a Level 1 area, an export policy must be explicitly configured.

NEW QUESTION # 181

.....

As the leader in the market for over ten years, our JN0-364 practice engine owns a lot of the advantages. Our JN0-364 study guide is featured less time input, high passing rate, three versions, reasonable price, excellent service and so on. All your worries can be wiped out because our JN0-364 learning quiz is designed for you. We hope that that you can try our free trials before making decisions.
