## ISQI ISTQB Certified Tester Foundation Level (CTFL) v4.0 Sample Questions (Q143-Q148):

### NEW QUESTION # 143

Which of the following statements is CORRECT about White-box testing?

- A. White-box testing helps find defects because it provides for requirements based coverage
- B. White-box testing helps find defects even when specifications are vague because it takes into account the code.
- C. White-box testing helps find defects because they can be used to measure statement coverage
- D. White-box testing helps find defects because it focuses on defects rather than failures

**Answer: C**

Explanation:

White-box testing, also known as structural testing, involves testing the internal structures or workings of an application, as opposed to its functionality (which is tested by black-box testing). The correct statement about white-box testing is that it helps find defects by

measuring aspects such as statement coverage.

\* Statement Coverage: White-box testing techniques like statement coverage measure whether each statement in the code has been executed at least once. This helps ensure that all parts of the code are tested and can reveal defects in areas that might not be reached by black-box testing alone.

Other statements are less accurate in the context of white-box testing:

\* Specifications being vague: White-box testing is code-focused, not requirement-focused. If specifications are vague, it affects both white-box and black-box testing. The main advantage of white-box testing is that it allows testers to create tests based on the code's structure and logic.

\* Requirements-based coverage: This is typically associated with black-box testing, which derives tests from specifications and requirements. White-box testing, on the other hand, derives tests from the code itself.

\* Focus on defects rather than failures: Both white-box and black-box testing aim to identify defects, but white-box testing does this through code coverage and examining the code paths directly. It does not focus exclusively on defects rather than failures; it is just another method to identify potential issues.

#### NEW QUESTION # 144

Which of the following statements about error guessing is true?

- A. Error guessing refers to the ability of a system or component to continue normal operation despite the presence of erroneous inputs
- B. Experienced testers, when applying error guessing, rely on the use of a high-level list of what needs to be tested as a guide to find defects
- C. Error guessing is a system that adopts artificial intelligence to predict whether software components are likely to contain defects or not
- **D. Experienced testers, when applying error guessing technique, can anticipate where errors, defects and failures have occurred and target their tests at those issues**

**Answer: D**

Explanation:

This answer is correct because error guessing is a test design technique where the experience and intuition of the tester are used to anticipate where errors, defects and failures have occurred or are likely to occur, and to design test cases to expose them. Error guessing can be based on factors such as the complexity of the system or component, the known or suspected weaknesses of the system or component, the previous history of defects, or the common types of errors in the domain or technology. Error guessing can be used as a complementary technique to other more systematic or formal techniques, or when there is insufficient information or time to apply them. #### NEW QUESTION # 145

Which of the following work products cannot be examined by static analysis?

- **A. Test plans**
- B. Formal models
- C. Compiled code
- D. Source code

**Answer: A**

Explanation:

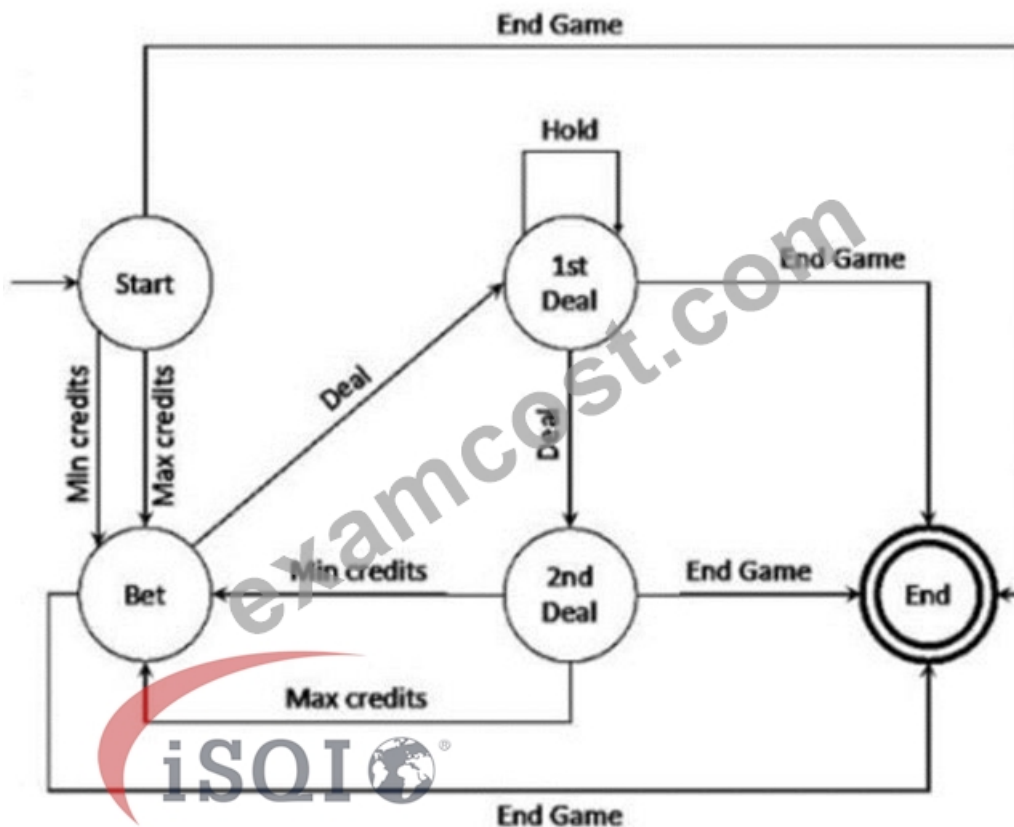

Static analysis is the process of examining the work products of a software development or testing activity without executing them. Static analysis can be applied to various types of work products, such as requirements, design, code, test cases, etc. However, test plans are not suitable for static analysis, because they are high-level documents that describe the test objectives, scope, strategy, resources, schedule, and risks of a testing project. Test plans are not executable or formalized in a way that static analysis tools can analyze them.

Therefore, option A is the correct answer.

#### NEW QUESTION # 146

Consider the following simplified version of a state transition diagram that specifies the behavior of a video poker game:

What Is the minimum number of test cases needed to cover every unique sequence of up to 3 states/2 transitions starting In the "Start" state and ending In the "End" state?

- A. 0
- B. 1
- C. 2
- **D. 3**

**Answer: D**

Explanation:

Explanation

The minimum number of test cases needed to cover every unique sequence of up to 3 states/2 transitions starting in the "Start" state and ending in the "End" state is 4. This is because there are 4 unique sequences of up to 3 states/2 transitions starting in the "Start" state and ending in the "End" state:

Start -> Bet -> End

Start -> Deal -> End

Start -> 1st Deal -> End

Start -> 2nd Deal -> End References: ISTQB Certified Tester Foundation Level (CTFL) v4.0 sources and documents.

#### NEW QUESTION # 147

Which ONE of the following elements is TYPICALLY used to guide testing during exploratory testing?

- A. A comprehensive specification that must be fully available before testing begins.
- B. A predefined test case that must be executed exactly as documented.
- **C. A test charter that defines the testing objectives for the test session.**
- D. A detailed test script that prescribes all the steps to be performed.

**Answer: C**

Explanation:

Exploratory testing is an unscripted approach where testers actively design and execute tests based on their intuition, experience, and knowledge of the system. A test charter (A) provides a guideline on what areas to explore, defining test objectives but leaving room for dynamic adaptation.

\* (B), (C), and (D) contradict exploratory testing principles, which focus on freedom rather than rigid documentation.

\* Exploratory testing is especially useful in agile environments, usability testing, and uncovering unexpected defects.
