Oracle Cloud Infrastructure 2025 Migration Architect Professional Sample Questions (Q34-Q39):

NEW QUESTION # 34

What is a valid purpose for creating multiple Migration Plans for each Migration Project in Oracle Cloud Migrations?

- A. To accelerate the migration task by assigning each Migration Plan to the respective migration team
- **B. To validate different compute shapes for each VM ensuring the most effective configuration can be chosen**
- C. To create a backup from the existing Migration Plan, as a precautionary measure against misconfiguration
- D. To incrementally increase the allocated budget for each Migration Plan

Answer: B

Explanation:

Creating multiple Migration Plans for each Migration Project allows for the validation of different compute shapes for each VM. This ensures that the most effective configuration can be chosen based on the specific requirements of each workload, leading to optimized performance and resource utilization in the Oracle Cloud Migration.

NEW QUESTION # 35

Which two statements are true about physical migration of Oracle databases?

- **A. Source and Target database versions must be the same**
- B. You cannot achieve zero or near-zero downtime with physical migration
- C. During physical migration, copies of database objects are created in dumps
- **D. You can run a cloud premigration advisor tool to perform compatibility check prior to migration**

- E. You cannot filter and migrate database objects

Answer: A,D

Explanation:

Running the cloud premigration advisor tool is a recommended practice before migration to perform a compatibility check and identify any potential issues. Also, for physical migration, the source and target database versions must be the same to ensure compatibility.

NEW QUESTION # 36

In Oracle Cloud Infrastructure (OCI), how are Security Lists different from Network Security Groups (NSGs) in terms of their functionality and application?

- A. Security Lists offer more advanced features such as intrusion detection and prevention, whereas NSGs focus solely on packet filtering and routing
- B. NSGs are primarily used for inbound traffic control, while Security Lists are exclusively utilized for outbound traffic control within a subnet
- C. Security Lists and NSGs are identical in functionality but differ only in naming conventions based on the OCI region where they are deployed
- **D. A Security List defines a set of security rules that applies to all the VNICs in a subnet whereas a Network Security Group lets you define a set of security rules that applies to a group of VNICs in a Virtual Cloud Network (VCN)**

Answer: D

Explanation:

A Security List in OCI defines a set of security rules that apply to all the Virtual Network Interface Cards (VNICs) within a subnet, while a Network Security Group (NSG) allows you to define a set of security rules that apply to a specific group of VNICs within a Virtual Cloud Network (VCN).

NEW QUESTION # 37

Which two are options for provisioning of Oracle Autonomous Database in the public cloud?

- A. Exadata Database on Dedicated Infrastructure
- **B. Serverless**
- C. Base Database
- **D. Dedicated Exadata Infrastructure**

Answer: B,D

Explanation:

Serverless and Dedicated Exadata Infrastructure are valid options for provisioning Oracle Autonomous Database in the public cloud.

NEW QUESTION # 38

As an OCI architect, you are designing a cloud environment to accommodate an on-premises Data Center workload, which currently has a memory oversubscription ratio of 2:1. The ratio means the total physical memory of the on-premises servers is 100 GB, and the virtual memory allocated is 200 GB. Upon source discovery, you discovered the actual physical memory utilization is below 50%. Which memory allocation strategy should you consider for the Bare Metal instances in OCI to optimize oversubscription, applying the actual utilization?

- A. Bare Metal instances with total 200 GB of physical memory to match the on-premises virtual memory allocation
- **B. Bare Metal instances with total 75 GB of physical memory, considering the actual utilization in physical memory**
- C. Bare Metal instances with total 250 GB of physical memory, anticipating potential spikes in memory demand
- D. Bare Metal instances with total 150 GB of physical memory, providing a middle ground that acknowledges the oversubscription in on-premises

Answer: B

Explanation:

Allocating Bare Metal instances with a total physical memory of 75 GB, considering the actual utilization in physical memory, is the most suitable strategy to optimize oversubscription. It aligns with the goal of optimizing resource allocation based on the discovered utilization, ensuring efficient use of resources in the cloud environment.
