## CyberArk Defender - PAM Sample Questions (Q106-Q111):

### NEW QUESTION # 106

You have been asked to secure a set of shared accounts in CyberArk whose passwords will need to be used by end users. The account owner wants to be able to track who was using an account at any given moment.

Which security configuration should you recommend?

- A. Configure object level access control on the appropriate safe.
- B. Configure shared account mode on the appropriate safe.
- C. Configure one-time passwords for the appropriate platform in Master Policy.
- **D. Configure both one-time passwords and exclusive access for the appropriate platform in Master Policy.**

**Answer: D**

Explanation:

Explanation

One-time passwords and exclusive access are security features that can be configured for a platform in the Master Policy. These features enhance the security and accountability of shared accounts by ensuring that each password is used only once and by only one user at a time. One-time passwords generate a new password for each check-out and check-in of an account, preventing password reuse and exposure. Exclusive access prevents multiple users from accessing the same account simultaneously, avoiding conflicts and confusion. By configuring both one-time passwords and exclusive access for the appropriate platform, the account owner can track who was using an account at any given moment and ensure that the passwords are always secure and unique.

### NEW QUESTION # 107

Which file must be edited on the Vault to configure it to send data to PTA?

- A. my.ini
- B. padr.ini
- C. PARAgent.ini
- **D. dbparm.ini**

**Answer: D**

Explanation:

Explanation

To configure the CyberArk Vault to send data to Privileged Threat Analytics (PTA), you must edit the dbparm.ini file on the Vault. This file contains parameters that specify how the Vault should forward syslog events to PTA, ensuring that the Vault can send secured syslog data to PTA for analysis and threat detection.

\* Netenrich: CyberArk Vault via Syslog1

### NEW QUESTION # 108

PTA can automatically suspend sessions if suspicious activities are detected in a privileged session, but only if the session is made via the CyberArk PSM.

- A. True
- **B. False, the PTA can suspend sessions whether the session is made via the PSM or not**

**Answer: B**

#### NEW QUESTION # 109

When on-boarding account using Accounts Feed, Which of the following is true?

- A. Any account that is on boarded can be automatically reconciled regardless of the platform it is associated with.
- B. You must specify an existing Safe where account will be stored when it is on boarded to the Vault
- **C. You can specify the name of a new safe that will be created where the account will be stored when it is on-boarded to the Vault.**
- D. You can specify the name of a new Platform that will be created and associated with the account

**Answer: C**

#### NEW QUESTION # 110

When a DR Vault Server becomes an active vault, it will automatically revert back to DR mode once the Primary Vault comes back online.

- A. True, if the AllowFailback setting is set to "yes" in the padr.ini file
- B. False, the Vault administrator must manually set the DR Vault to DR mode by setting "FailoverMode=no" in the dbparm.ini file
- **C. False, the Vault administrator must manually set the DR Vault to DR mode by setting "FailoverMode=no" in the padr.ini file**
- D. True; this is the default behavior

**Answer: C**

Explanation:

Explanation

According to the web search results, when a DR Vault Server becomes an active vault, it will not automatically revert back to DR mode once the Primary Vault comes back online. The Vault administrator must manually set the DR Vault to DR mode by setting "FailoverMode=no" in the padr.ini file<sup>1</sup>. This file is located in the /opt/CARkaim/conf directory on the DR Vault machine<sup>2</sup>. The Vault administrator must also stop the replication process on the DR Vault and restart the PrivateArk Server service<sup>1</sup>. This procedure is known as a DR failback, which restores the original roles of the Primary Vault and the DR Vault after a failover<sup>1</sup>. The AllowFailback setting in the padr.ini file does not affect the DR failback process, as it only determines whether the DR Vault can be used as a backup for another DR Vault in a cascading DR scenario<sup>3</sup>.

The dbparm.ini file is not relevant for the DR failback process, as it contains the database parameters for the Vault server.
