Salesforce Certified MuleSoft Integration Associate Exam Sample Questions (Q25-Q30):

NEW QUESTION # 25

A Kubernetes controller automatically adds another pod replica to the resource pool in response to increased application load. Which scalability option is the controller implementing?

- **A. Horizontal**
- B. Diagonal
- C. Vertical
- D. Down

Answer: A

Explanation:

Kubernetes offers several scalability options to handle varying application loads. The scenario described involves adding another pod replica in response to increased load, which is a form of horizontal scaling.

Here's a detailed explanation:

* Horizontal Scaling:

* Definition: Horizontal scaling, also known as scaling out, involves adding more instances (pods) to distribute the load and increase capacity.

* Implementation in Kubernetes: Kubernetes uses controllers like the Horizontal Pod Autoscaler (HPA) to automatically adjust the number of pod replicas based on observed CPU utilization or other select metrics.

* Benefits:

* Load Distribution: By adding more pod replicas, the load is evenly distributed, reducing the risk of any single pod being overwhelmed.

* Fault Tolerance: Horizontal scaling enhances fault tolerance and availability, as multiple pod replicas can handle requests if one fails.

* Automatic Scaling:

* Kubernetes Controller: The HPA continuously monitors the application load and adjusts the number of pod replicas accordingly, ensuring optimal performance.

NEW QUESTION # 26

An organization is choosing between API-led connectivity and other integration approaches. According to MuleSoft, which business benefit is associated with an API-led connectivity approach using Anypoint Platform?

- **A. Increased developer productivity through self-service of API assets**
- B. Higher outcome repeatability through centralized development
- C. Greater project predictability through tight coupling of systems
- D. Improved security through adoption of monolithic architectures

Answer: A

Explanation:

API-led connectivity is an approach that emphasizes the reuse of APIs to enhance agility and productivity.

Here's a detailed explanation of the associated business benefits:

* Self-Service of API Assets:

* Definition: API-led connectivity enables developers to discover, access, and use APIs through a centralized platform like Anypoint Exchange, promoting self-service.

* Productivity: Developers can quickly find and integrate existing APIs, reducing the time and effort required to build new

functionalities from scratch.

* Business Benefits:

* Reusability: Encourages the reuse of APIs across projects, leading to faster development cycles and reduced duplication of efforts.

* Agility: Enhances the ability to respond to changing business needs by providing a flexible and modular integration framework.

* Scalability: Facilitates the scaling of integration solutions as business requirements grow.

NEW QUESTION # 27

An integration team follows MuleSoft's recommended approach to full lifecycle API development. Which activity should this team perform during the API implementation phase?

- A. Design the API specification
- B. Use the API specification to monitor the MuleSoft application
- C. Validate the API specification
- **D. Use the API specification to build the MuleSoft application**

Answer: D

Explanation:

MuleSoft recommends a full lifecycle API development approach which includes several phases such as design, implementation, testing, deployment, and management. During the API implementation phase, the primary activity is to use the API specification to build the MuleSoft application. Here's a detailed explanation:

* API Design:

* Create API Specification: Initially, an API specification is created using RAML or OAS (OpenAPI Specification) to define the API's structure, endpoints, request/response formats, and security requirements.

* API Implementation:

* Build Mule Application: Using the API specification as a blueprint, the development team implements the MuleSoft application. This involves creating flows, integrating with backend systems, and ensuring the API functions as specified.

* APIKit: MuleSoft provides APIKit, a tool that automatically generates Mule flows based on the API specification, speeding up the development process.

* Testing: During implementation, unit tests (using MUnit) and integration tests are created to ensure the API behaves as expected.

* Validation and Monitoring:

* Validate Against Specification: Throughout the implementation phase, the API is continuously validated against the original specification to ensure compliance.

* Deployment and Monitoring: Post-implementation, the API is deployed, and tools like Anypoint Monitoring are used to monitor its performance and usage.

NEW QUESTION # 28

An IT integration team followed an API-led connectivity approach to implement an order-fulfillment business process. It created an order processing API that coordinates stateful interactions with a variety of microservices that validate, create and fulfill new product orders.

Which interaction composition pattern did the integration architect who designed this order processing API use?

- A. Streaming
- B. Multicasting
- C. Aggregation
- **D. Orchestration**

Answer: D

Explanation:

In an API-led connectivity approach, different APIs are layered to provide modular and reusable services. For an order processing API that coordinates stateful interactions with various microservices, the integration architect used the orchestration interaction composition pattern. Here's a step-by-step explanation:

* Understanding Orchestration:

* Definition: Orchestration involves coordinating multiple services to achieve a complex business workflow. Unlike choreography, which relies on each service knowing its part, orchestration uses a central controller to manage the interactions.

* Role of the Orchestrator: The orchestrator manages the execution sequence, handles the state, and ensures all the necessary steps are completed successfully.

* Order Processing API:

* API-Led Connectivity: An order processing API, following API-led connectivity, sits in the Process layer, handling complex business processes and logic.

* Stateful Interactions: Orchestration is particularly suitable for stateful interactions where the process needs to remember the state between steps, such as validating an order, creating it, and fulfilling it.

* Implementation Steps:

* Microservices Interaction: The order processing API interacts with various microservices:

* Validation Microservice: Checks the validity of the order details.

* Creation Microservice: Creates the order in the system.

* Fulfillment Microservice: Manages the order fulfillment process.

* Coordination: The API orchestrates these steps, ensuring each one completes successfully before moving to the next, handling exceptions, and maintaining the state of the process.

NEW QUESTION # 29

Which Anypoint Platform component helps integration developers discover and share reusable APIs, connectors and templates'?

- A. Anypoint Studio
- B. Design Center
- C. API Manager
- D. Anypoint Exchange

Answer: D

Explanation:

Anypoint Exchange is a component of the Anypoint Platform that helps integration developers discover and share reusable APIs, connectors, and templates. Here's a detailed explanation:

* Anypoint Exchange:

* Purpose: Acts as a centralized repository for discovering, sharing, and reusing APIs, connectors, templates, and other integration assets.

* Discovery: Developers can search for and find existing APIs, connectors, and templates within the organization or from the wider MuleSoft community.

* Sharing: Allows developers to publish their APIs and assets, making them available for reuse by others in the organization.

* Benefits:

* Reusability: Promotes reuse of existing assets, reducing development time and effort.

* Collaboration: Facilitates collaboration and sharing of best practices among development teams.

* Documentation: Provides comprehensive documentation and usage examples for each asset.
