WGUSecure Software Design (KEO1) Exam Sample Questions (Q48-Q53):

NEW QUESTION # 48
The security team has received notice of an insecure direct object reference vulnerability in a third-party component library that could result in remote code execution. The component library was replaced and is no longer being used within the application. How should the organization remediate this vulnerability?

- A. Access to Configuration Files Is Limited to Administrators
- B. Enforce the Removal of Unused Dependencies
- C. Ensure Auditing and Logging Is Enabled on All Servers
- D. Ensure Sensitive Information Is Not Logged

Answer: B

NEW QUESTION # 49
In which step of the PASTA threat modeling methodology is vulnerability and exploit analysis performed?

- A. Define objectives
- B. Attack modeling
- C. Application decomposition
- D. Define technical scope

Answer: B

Explanation:
In the PASTA (Process for Attack Simulation and Threat Analysis) threat modeling methodology, vulnerability and exploit analysis is performed during the Attack modeling step. This step involves identifying potential threats and vulnerabilities within the system and understanding how they could be exploited.
* Attack modeling is a critical phase where the focus is on simulating attacks based on identified vulnerabilities. It allows for a deep understanding of the threats in the context of the application's architecture and system design.
* During this phase, security analysts use their knowledge of the system's technical scope and application decomposition to simulate how an attacker could exploit the system's vulnerabilities. This helps in prioritizing the risks and planning appropriate mitigation strategies.
* The goal of attack modeling is not just to identify vulnerabilities but also to understand the potential impact of exploits on the system and the business, which is essential for developing a robust security posture.
References: The information provided is aligned with the PASTA methodology as described in resources such as VerSprite1 and the OWASP Foundation2. These sources detail the seven stages of PASTA, with attack modeling being a key component of the process.

NEW QUESTION # 50
Which secure coding best practice says to require authentication before allowing any files to be uploaded and to limit the types of files to only those needed for the business purpose?

* A. File management
* B. Communication security
* C. Memory management
* D. Data protection

Answer: A

Explanation:
The secure coding best practice that requires authentication before allowing any files to be uploaded, and limits the types of files to only those needed for the business purpose, falls under the category of File Management. This practice is crucial for preventing unauthorized file uploads, which can be a common vector for attacks such as uploading malicious files or scripts. By enforcing authentication, the application ensures that only legitimate users can upload files. Additionally, restricting the file types to those necessary for business operations minimizes the risk of uploading potentially harmful files that could compromise the system.

NEW QUESTION # 51
Developers have finished coding, and changes have been peer-reviewed. Features have been deployed to a pre- production environment so that analysts may verify that the product is working as expected.
Which phase of the Software Development Life Cycle (SDLC) is being described?

* A. Deployment
* B. Requirements
* C. Testing
* D. Design

Answer: C

Explanation:
Comprehensive and Detailed In-Depth Explanation:
The scenario describes a stage where the developed features are deployed to a pre-production environment for verification by analysts. This aligns with the Testing phase of the Software Development Life Cycle (SDLC).
In the Testing phase, the system undergoes various evaluations to ensure it meets the specified requirements and functions correctly. This includes deploying the software in an environment that simulates production to identify and rectify defects before the actual deployment. The primary goal is to validate the software's quality and performance.
According to the SDLC framework, after the development (coding) phase, the next step is Testing, where the system is rigorously evaluated. This phase is crucial to detect issues that may not have been apparent during development and to ensure that the software operates as intended in a controlled setting before live deployment.
