Microsoft Planning and Administering Microsoft Azure for SAP Workloads Sample Questions (Q294-Q299):

NEW QUESTION # 294

You have an SAP environment on Azure.

You use Azure Recovery Services to back up an SAP application server.

You need to test the restoration process of a file on the server.

Which three actions should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Answer:

Explanation:

Explanation

- Step 1: From Azure Recover Vault, select File Recovery
To restore files or folders from the recovery point, go to the virtual machine and choose the desired recovery point.
- Step 2: Download and run the mount disk executable
- Step 3: recover the file and unmount the disk

NEW QUESTION # 295

You have an SAP production landscape in Azure.

You need to recommend a disaster recovery solution that will enable failover between two Azure regions. The solution must provide the lowest recovery time objective (RTO) for a Microsoft SQL Server instance and SAP Central Services (SCS).

What should you include in the recommendation? To answer, drag the appropriate recommendations to the correct workloads. Each recommendation may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Answer:

Explanation:

NEW QUESTION # 296

You deploy an SAP environment on Azure.

Your company has a Service Level Agreement (SLA) of 99.99% for SAP.

You implement Azure Availability Zones that have the following components:

- * Redundant SAP application servers
- * ASCS/ERS instances that use a failover cluster
- * Database high availability that has a primary instance and a secondary instance You need to validate the load distribution to the application servers. What should you use?

- A. SAP Web Dispatcher
- **B. SAPControl**
- C. SAP Solution Manager
- D. Azure Monitor

Answer: B

Explanation:

Explanation

Load balancers. These are used to distribute traffic to virtual machines in the application-tier subnet. For high availability, use the built-in SAP Web Dispatcher, Azure Load Balancer, or network appliances, depending on the traffic type (such as HTTP or SAPGUI) or the required network services, such as Secure Sockets Layer (SSL) termination.
