The Best Mule-Dev-202 Detailed Study Plan & Leader in Certification Exams Materials & Fantastic Mule-Dev-202 Valid Dumps Questions

Some of our customers are white-collar workers with no time to waste, and need a Salesforce certification urgently to get their promotions, meanwhile the other customers might aim at improving their skills. So we try to meet different requirements by setting different versions of our Mule-Dev-202 question and answers. The special one is online Mule-Dev-202 engine version. As an online tool, it is convenient and easy to study, supports all Web Browsers and system including Windows, Mac, Android, iOS and so on. You can apply this version of Mule-Dev-202 exam questions on all eletric devices.

Salesforce Certified MuleSoft Hyperautomation Developer Sample Questions (Q22-Q27):

NEW QUESTION # 22

An AnyAirlines employee determines that an RPA process is a strong candidate for automation. When approving the process, the employee needs to specify a group of potential users to manage the RPA process throughout its lifecycle.

According to best practices, which group should the employee choose?

- A. Scrum team
- B. Center of Excellence
- C. Multiple project managers
- D. Center for Enablement

Answer: B

Explanation:

When approving an RPA process and specifying a group of potential users to manage it throughout its lifecycle, the best practice is to choose the Center of Excellence (CoE):

Center of Excellence (CoE):

The CoE is a team of experts who are responsible for overseeing the implementation, governance, and management of RPA processes within the organization.

They ensure that best practices are followed, provide guidance and support to project teams, and manage the overall RPA strategy and roadmap.

Lifecycle Management:

The CoE is well-equipped to manage the RPA process from initial development through deployment and ongoing maintenance. They have the expertise to handle any issues that arise and ensure the process remains efficient and effective.

Best Practices:

By involving the CoE, the organization ensures that the RPA process adheres to established best practices, maintains high quality, and delivers the expected benefits.

NEW QUESTION # 23

AnyAirlines has a MuleSoft Composer flow between NetSuite and Salesforce. One of the data elements coming from NetSuite is a string that needs to be put into a Boolean field in a Salesforce object.

Which Composer function should be used to change the datatype of the value?

- A. fromBooleanToString()
- B. **fromStringToBoolean()**
- C. substitute()
- D. today()

Answer: B

Explanation:

To convert a string from NetSuite into a Boolean field in a Salesforce object within MuleSoft Composer, you should use the `fromStringToBoolean()` function:

Function Purpose:

The `fromStringToBoolean()` function is specifically designed to convert string values to Boolean values. It interprets common Boolean strings like "true", "false", "yes", "no" and converts them into their corresponding Boolean values.

Usage:

Within MuleSoft Composer, use this function in a transformation step to ensure the data coming from NetSuite (as a string) is correctly transformed into a Boolean value before it is mapped to the Salesforce object.

Example:

If the string value from NetSuite is "true", `fromStringToBoolean("true")` will convert this to `true` in the Boolean field in Salesforce.

NEW QUESTION # 24

Northern Trail Outfitters developed an integration between its two Salesforce orgs using MuleSoft Composer.

Which two actions should be taken before testing the Composer flow? (Choose two.)

- A. Ensure the flow trigger is connected to a sandbox instance of Salesforce.
- B. Ensure the credentials to the target production org are still valid.

- C. Ensure MuleSoft Composer is installed on both the source and target orgs.
- D. Ensure action steps are connected to a sandbox instance of Salesforce.

Answer: A,D

Explanation:

Flow Trigger Connection: Before testing any Composer flow, it is crucial to connect the flow trigger to a sandbox instance of Salesforce. This ensures that testing does not impact the production environment. The sandbox provides a safe space to simulate real-world conditions without the risk of data corruption or unintended actions in the live system.

Reference: [Salesforce Sandbox Documentation](#)

Action Steps Connection: Similar to the flow trigger, action steps within the Composer flow should also be connected to a sandbox instance. This allows comprehensive testing of the flow's functionality, ensuring that each step performs as expected without affecting the production data.

Reference: [MuleSoft Composer Guide](#)

Ensuring Validity of Credentials: While it is important to ensure that credentials to the production org are valid when moving to production, for testing purposes, the emphasis is on sandbox connections. The credentials should be verified to avoid disruptions during testing.

Reference: [MuleSoft Composer Flow Setup](#)

Installation of MuleSoft Composer: MuleSoft Composer does not need to be installed on both the source and target orgs as it operates independently and connects to these orgs through provided credentials.

NEW QUESTION # 25

An RPA process is invoked by a MuleSoft Composer flow. The RPA process has a User Task that can take up to 24 hours to complete.

- A. Create a second MuleSoft Composer flow that starts when the RPA process is complete.
- B. Wait for the RPA process to complete and invoke a second MuleSoft Composer flow via REST API.
- C. Wait for the RPA process to complete and use the results in the same MuleSoft Composer flow.
- D. Using best practices, how should the results be consumed by MuleSoft Composer?
- E. Create a second MuleSoft Composer flow that runs on a schedule and checks if the RPA process is complete.

Answer: A

Explanation:

When an RPA process involves a User Task that can take a significant amount of time (up to 24 hours) to complete, it is best to use a follow-up mechanism to handle the results once the process is finished:

Second MuleSoft Composer Flow:

Create a second MuleSoft Composer flow that is triggered when the RPA process completes. This ensures that the first flow is not held up while waiting for the long-running RPA process to finish.

The second flow can start based on an event, such as the completion status of the RPA process, ensuring timely and efficient processing of the results.

Trigger Mechanism:

Configure the RPA process to notify MuleSoft Composer when it is complete, possibly using a REST API or another integration method.

Best Practices:

This approach adheres to best practices by keeping flows modular and focused on specific tasks, making them easier to manage and troubleshoot.

NEW QUESTION # 26

AnyAirlines needs to automatically sync Salesforce accounts with NetSuite customers using a MuleSoft Composer flow. The Address field in the Salesforce Account object is a compound field consisting of the simple fields: Street, City, State, Zip, and Country.

However, the Address field in the NetSuite Customer entity is a list consisting of the simple fields: Street, City, State, Zip, and Country.

Which task must be performed to map fields of the Salesforce Address compound field to the corresponding fields of the NetSuite

Address list in the flow?

- A. Combine the Salesforce address-related fields into a list using the Get records action in Composer.
- B. **Combine the Salesforce address-related fields into a list using a custom expression in Composer.**
- C. Break up the NetSuite Address list into fields that match Salesforce address-related fields using a custom formula field in NetSuite.
- D. Combine the Salesforce address-related fields into a list using a custom formula field in Salesforce.

Answer: B

Explanation:

To map fields of the Salesforce Address compound field to the corresponding fields of the NetSuite Address list in MuleSoft Composer, you need to perform the following task:

Custom Expression in Composer:

Use a custom expression in MuleSoft Composer to combine the individual address-related fields from Salesforce (Street, City, State, Zip, Country) into a format that matches the NetSuite Address list.

This custom expression will concatenate the individual simple fields from Salesforce into a structured format that can be mapped directly to the NetSuite Address list.

Mapping the Fields:

Once the custom expression is created, map the resulting list to the corresponding fields in the NetSuite Customer entity within the Composer flow.

This ensures that each simple field in the Salesforce compound Address field is correctly mapped to the respective field in the NetSuite Address list.
