최신 SAP Certified Associate C_ABAPD_2507 무료샘플문제 (Q74-Q79):

질문 # 74

Which function call returns 0?

- A. `find_any_not_of( val 'ABAP ABAP abap' sub = 'AB' )`
- B. `Count( val - 'ABAP ABAP abap' sub - 'AB' )`
- C. `find_any_of( val = "ABAP ABAP abap" sub = "AB" )`
- D. `Count_any_of( val - 'ABAP ABAP abap' sub "AB" )`

정답: A

설명:

The function `find_any_not_of` returns the position of the first character in the string `val` that is not contained in the string `sub`. If no such character is found, the function returns 0. In this case, the string `val` contains only the characters A, B, and a, which are all contained in the string `sub`, so the function returns 0. The other functions return positive values, as follows:

Count_any_of returns the number of occurrences of any character in the string sub within the string val. In this case, it returns 8, since there are 8 A's and B's in val.

Count returns the number of occurrences of the string sub within the string val. In this case, it returns 2, since there are 2 AB's in val.

find_any_of returns the position of the first character in the string val that is contained in the string sub. In this case, it returns 1, since the first character A is in sub. Reference: String Functions - ABAP Keyword Documentation, Examples of String Functions - ABAP Keyword Documentation

질문 # 75

What RESTful Application Programming object contains only the fields required for a particular app?

- A. Metadata extension
- B. Database view
- C. Data model view
- **D. Projection View**

정답: D

설명:

A projection view is a RESTful Application Programming object that contains only the fields required for a particular app. A projection view is a CDS view entity that defines a projection on an existing CDS view entity or CDS DDIC-based view. A projection view exposes a subset of the elements of the projected entity, which are relevant for a specific business service. A projection view can also define aliases, virtual elements, and annotations for the projected elements. A projection view is the top-most layer of a CDS data model and prepares data for a particular use case. A projection view can have different provider contracts depending on the type of service it supports, such as transactional query, analytical query, or transactional interface.

A database view is a CDS DDIC-based view that defines a join or union of database tables. A database view has an SQL view attached and can be accessed by Open SQL or native SQL. A database view can be used as a projected entity for a projection view, but it does not contain only the fields required for a particular app.

A metadata extension is a RESTful Application Programming object that defines additional annotations for a CDS view entity or a projection view. A metadata extension can be used to enhance the metadata of a CDS data model without changing the original definition. A metadata extension does not contain any fields, but only annotations.

A data model view is a CDS view entity that defines a data model based on database tables or other CDS view entities. A data model view can have associations, aggregations, filters, parameters, and annotations. A data model view can be used as a projected entity for a projection view, but it does not contain only the fields required for a particular app.

질문 # 76

What RESTful Application Programming feature is used to ensure the uniqueness of a semantic key?

- A. Action
- B. None of the above
- **C. Validation**
- D. Determination

정답: C

설명:

Comprehensive and Detailed Explanation From Exact Extract:

In the ABAP RESTful Application Programming Model (RAP), validations are used to ensure that business rules and constraints are fulfilled, including the uniqueness of semantic keys.

A semantic key represents a natural identifier (e.g., employee number, product ID) and not a technical surrogate key. Validations can be:

* Field-level validations - used to validate input for single fields.

* Entity-level validations - used to validate logical conditions like uniqueness of a key combination.

The uniqueness check is typically enforced using a custom validation implementation in the behavior pool.

* Action (Option A) is used for operations triggered by the user or system but not for enforcing uniqueness.

* Determination (Option C) is used for automatically computing or adjusting field values, not for enforcing uniqueness.

Reference: SAP Help 1, page 7 - RAP Runtime and behavior definition section explains how validations are responsible for enforcing semantic consistency and uniqueness constraints.

질문 # 77

Which of the following are features of Core Data Services (CDS)?
(Select 3 correct answers)

- A. Associations
- B. Annotations
- C. Inheritance
- D. Structured Query Language (SQL)
- E. Delegation

정답: A,B,D

설명:

Comprehensive and Detailed Explanation from Exact Extract:

* Associations ## Supported in CDS to define relationships between entities without materializing joins.

* SQL (Structured Query Language) ## CDS is built on SQL semantics and supports declarative data modeling with SQL-based syntax.

* Annotations ## Used to enrich CDS artifacts with metadata for UI, OData exposure, and behavior.

* Delegation ## Not a CDS feature; belongs to OO or API design patterns.

* Inheritance ## Not supported in CDS entities; CDS focuses on associations and compositions.

질문 # 78

Which function call produces the string 'LORE_IPSUM_FACTUM'?

- A. `from_mixed( val = 'LorelpsumFactum' sep = ' ' )`
- B. `to_upper( condense( 'LorelpsumFactum' ) )`
- C. `condense( to_upper( 'LorelpsumFactum' ) )`
- D. `to_mixed( val = 'LorelpsumFactum' sep = ' ' )`

정답: A

설명:

Comprehensive and Detailed Explanation from Exact Extract:

* `from_mixed` converts a mixed-case string into uppercase with a chosen separator between words.

* Given input 'LorelpsumFactum', the function splits at uppercase letters, uppercases the parts, and joins them with _.

* Output: LORE_IPSUM_FACTUM.

* `condense` only removes extra spaces, `to_upper` only changes case, and `to_mixed` does the reverse of `from_mixed`.

Study Guide Reference: ABAP Keyword Documentation - String Functions (`from_mixed`, `to_mixed`).
