## CompTIA PenTest+ Exam Sample Questions (Q203-Q208):

### NEW QUESTION # 203

A penetration tester initiated the transfer of a large data set to verify a proof-of-concept attack as permitted by the ROE. The tester noticed the client's data included PII, which is out of scope, and immediately stopped the transfer. Which of the following MOST likely explains the penetration tester's decision?

- A. The tester had the situational awareness to stop the transfer.
- B. The tester completed the assigned part of the assessment workflow.
- C. The tester found evidence of prior compromise within the data set.
- D. The tester reached the end of the assessment time frame.

**Answer: A**

Explanation:

Situational awareness is the ability to perceive and understand the environment and events around oneself, and to act accordingly. The penetration tester demonstrated situational awareness by stopping the transfer of PII, which was out of scope and could have violated the ROE or legal and ethical principles. The other options are not relevant to the situation or the decision of the penetration tester.

### NEW QUESTION # 204

A tester compromises a target host and then wants to maintain persistent access. Which of the following is the best way for the attacker to accomplish the objective?

- A. Install and run remote desktop software.
- B. Set up a script to be run when users log in.
- C. Perform a kerberoasting attack on the host.
- D. Configure and register a service.

**Answer: D**

Explanation:

\* Configuring and Registering a Service:

- \* Registering a malicious service ensures that it starts automatically with the system, providing persistence even after reboots.
- \* This method is stealthier than others and is commonly used in advanced persistent threat (APT) scenarios.
- \* Why Not Other Options?
- \* B (Remote desktop software): Installing such software is noisy and can easily be detected by monitoring tools.
- \* C (User logon script): While it provides persistence, it is less reliable and more detectable than a system service.
- \* D (Kerberoasting): This is a credential-stealing technique and does not establish persistence.

### NEW QUESTION # 205

During a security assessment, a penetration tester uses a tool to capture plaintext log-in credentials on the communication between a user and an authentication system. The tester wants to use this information for further unauthorized access. Which of the following tools is the tester using?

- A. Burp Suite
- B. Metasploit
- C. Wireshark
- D. Zed Attack Proxy

**Answer: C**

Explanation:

Wireshark is a network packet analyzer used to capture and analyze network traffic in real-time. During a penetration test, it is often used to inspect unencrypted communication to extract sensitive information like plaintext login credentials. Here's how it works:

\* Packet Capturing: Wireshark captures the network packets transmitted over a network interface. If a user logs in through an insecure communication protocol (e.g., HTTP, FTP, or Telnet), the credentials are transmitted in plaintext.

\* Traffic Filtering: Using filters (e.g., http, tcp.port == 21), the tester narrows down the relevant traffic to locate the login request and response packets.

\* Sensitive Data Extraction: Analyzing the captured packets reveals plaintext credentials in the data payload, such as in HTTP POST requests.

\* Exploit the Information: After extracting the plaintext credentials, the tester can attempt unauthorized access to resources using these credentials.

### NEW QUESTION # 206

Hotspot Question

A penetration tester is performing reconnaissance for a web application assessment. Upon investigation, the tester reviews the robots.txt file for items of interest.

INSTRUCTIONS

Select the tool the penetration tester should use for further investigation.

Select the two entries in the robots.txt file that the penetration tester should recommend for removal.

If at any time you would like to bring back the initial state of the simulation, please click the Reset All button.

**Answer:**

Explanation:

Explanation:

The tool that the penetration tester should use for further investigation is WPScan. This is because WPScan is a WordPress vulnerability scanner that can detect common WordPress security issues, such as weak passwords, outdated plugins, and misconfigured settings. WPScan can also enumerate WordPress users, themes, and plugins from the robots.txt file. The two entries in the robots.txt file that the penetration tester should recommend for removal are:

Allow: /admin

Allow: /wp-admin

These entries expose the WordPress admin panel, which can be a target for brute-force attacks, SQL injection, and other exploits.

Removing these entries can help prevent unauthorized access to the web application's backend. Alternatively, the penetration tester can suggest renaming the admin panel to a less obvious name, or adding authentication methods such as two-factor authentication or IP whitelisting.

### NEW QUESTION # 207

In Python socket programming, SOCK\_DGRAM type is:

- A. matrixed.
- B. reliable.
- C. connectionless.
- D. slower.

**Answer: C**

Explanation:

In Python socket programming, SOCK\_DGRAM type is connectionless. This means that the socket does not establish a reliable connection between the sender and the receiver, and does not guarantee that the packets will arrive in order or without errors. SOCK\_DGRAM type is used for UDP (User Datagram Protocol) sockets, which are faster and simpler than TCP (Transmission Control Protocol) sockets.
