Valid Test 1z0-076 Bootcamp | Reliable 1z0-076 Exam Dumps

1z0-076 questions & answers are valid, covering the whole chapter in the actual test and the key points. You can take 1z0-076 pdf torrent as your study reference. After you get the 1z0-076 exam dumps, do not worry about the update, because one year free update is provided to you. Please pay attention to your payment email and check if there is any 1z0-076 Updated Dumps. Dear, if you have any questions about 1z0-076 study torrent, you can contact us by email or online chat as you like. In addition, we have money back guarantee, in case of failure, we will give you full refund.

Oracle 1z0-076 Exam Syllabus Topics:

Topic	Details
Topic 1	• Creating a Data Guard Broker Configuration: This section delves into the practical aspects of creating and managing a Data Guard broker configuration, including command-line and Enterprise Manager approaches.
Topic 2	• Managing Oracle Net Services in a Data Guard Environment: The section focuses on Oracle Net Services and its role in Data Guard networking setup.
Topic 3	• Using Oracle Active Data Guard: Supported Workloads in Read-Only Standby Databases: Here, the usage of physical standby databases for real-time queries is discussed.
Topic 4	• Oracle Data Guard Basics: This topic covers the essential architecture and concepts of Oracle Data Guard. It includes sub-topics such as the physical and logical standby database comparison, benefits of Data Guard, and its integration with multi-tenant databases.
Topic 7	• Patching and Upgrading Databases in a Data Guard Configuration: This section provides guidance on patching and upgrading databases in a Data Guard environment, along with performance optimization techniques and monitoring considerations.
Topic 8	• Monitoring a Data Guard Broker Configuration: The topic covers the use of Enterprise Manager and DGMGRL to monitor Data Guard configurations and explains the various data protection modes available.
Topic 9	• Managing Physical Standby Files After Structural Changes on the Primary Database: The topic covers managing structural changes in the primary database and their impact on physical standby files.

Topic 10	• Creating a Logical Standby Database: This topic guides users through the process of creating and managing a logical standby database, including SQL Apply filtering.
Topic 11	• Enhanced Client Connectivity in a Data Guard Environment: This topic focuses on enhancing client connectivity in a Data Guard setup and implementing failover procedures for seamless client redirection. It also covers application continuity to ensure uninterrupted operations during role transitions.
Topic 12	• Oracle Data Guard Broker Basics: An overview of the Data Guard broker, its architecture, components, benefits, and configurations, is provided here. It serves as an introduction to the tool used for managing Data Guard configurations.

Pass Guaranteed 2026 Oracle 1z0-076 Authoritative Valid Test Bootcamp

The 1z0-076 study questions included in the different versions of the PDF， Software and APP online which are all complete and cover up the entire syllabus of the exam. And every detail of these three vesions are perfect for you to practice and prapare for the exam. If you want to have a try before you pay for the 1z0-076 Exam Braindumps, you can free download the demos which contain a small part of questions from the 1z0-076 practice materials. And you can test the functions as well.

Oracle Database 19c: Data Guard Administration Sample Questions (Q68-Q73):

NEW QUESTION # 68
Which two are true about database roles in an Oracle Data Guard configuration?

- A. A Snapshot Standby Database can be a fast-start failover target.
- B. A configuration consisting only of a primary and one or more physical standby databases can support a rolling release upgrade.
- C. A Logical Standby Database can cascade redo to a terminal destination.
- D. A Physical Standby Database can be converted into a Logical Standby Database.
- E. A Logical Standby Database can be converted to a Snapshot Standby Database.

Answer: B,D

Explanation:
A Physical Standby Database can indeed be converted into a Logical Standby Database, providing flexibility in a Data Guard configuration. This allows for the database to switch roles and supports SQL apply operations, enabling more granular control over the data and transactions being replicated and applied. Additionally, having a configuration with a primary database and one or more physical standby databases allows for rolling upgrades to be performed. This means that each database in the Data Guard configuration can be upgraded in a phased manner, minimizing downtime and ensuring high availability during the upgrade process.

NEW QUESTION # 69
Which THREE are true about using flashback database in a Data Guard environment?

- A. It may not be used to flash back a primary database after a failover to a physical standby.
- B. When a flashback database operation is performed on a primary database, a logical standby database is also flashed back automatically.
- C. When a flashback database operation is performed on a primary database, a physical standby database is also flashed back automatically.
- D. You can use it when real-time apply is enabled in case the physical standby suffers from logical corruption.
- E. It may be used to flash back a physical standby that receives redo from a far sync instance.
- F. You can use it when real-time apply is enabled in case the phylt may not be used to flash back a primary database after a failover to a logical standby.

Answer: A,D,E

NEW QUESTION # 70

You notice that the SQL apply lag on your logical standby database has increased but the redo transport lag has not.

Which four could be reasons for the increase in SQL apply lag?

- A. Many SQL apply operations do full table scans
- B. An increased number of bulk inserts on the primary
- C. An undersized shared pool
- D. An increased number of bulk updates on the primary
- E. The standby redo log files are undersized on the primary database
- F. An undersized undo tablespace on the logical standby

Answer: A,C,D,F

Explanation:

The SQL apply lag on a logical standby database can be caused by several factors:

* A: An undersized undo tablespace can lead to delays in SQL apply operations as it may not be able to handle the volume of undo records generated by the SQL apply process.

* B: SQL apply operations that do full table scans can consume significant system resources, potentially leading to higher apply lag.

* C: An increased number of bulk updates on the primary database may generate a large volume of redo data, which can cause apply lag if the logical standby cannot apply the changes quickly enough.

* F: An undersized shared pool may affect the parsing and execution of SQL statements by SQL apply, which can contribute to the apply lag.

Option D is less likely to be a direct cause of SQL apply lag compared to bulk updates, as inserts generate new data rather than modifying existing data, which SQL apply can typically handle more efficiently.

Option E is incorrect because the size of the standby redo log files on the primary database impacts redo transport lag, not SQL apply lag.

References: Oracle Database High Availability Overview and Oracle Data Guard Concepts and Administration guide provide insights into the factors affecting SQL apply performance on logical standby databases.

NEW QUESTION # 71

You are using Data Guard in conjunction with Global Database Services.

You have a Data Guard Broker configuration called Sales and a GDS pool called Prod.

Which three are true concerning the management of the broker configuration when using GDS?

- A. Adding a database to the Sales configuration with DGMGRL requires that the Sales configuration be disabled first. It must then be enabled after the new database is added to the configuration.
- B. Performing a role change with DGMGRL automatically notifies GDS which in turn activates the appropriate services.
- C. DGMGRL may be used to add a single database to the Sales configuration even if Sales is a member of the Prod pool.
- D. Adding a database to the Sales configuration with DGMGRL automatically adds the database to the Prod Pool.
- E. DGMGRL may be used to add the Sales configuration to the Prod pool in gds.

Answer: B,C,E

Explanation:

In the context of Oracle Data Guard and Global Database Services (GDS):

DGMGRL may be used to add the Sales configuration to the Prod pool in gds (A): Data Guard Broker's command-line interface DGMGRL can be utilized to manage configurations with GDS, allowing the addition of Data Guard Broker configurations to GDS pools.

Performing a role change with DGMGRL automatically notifies GDS which in turn activates the appropriate services (B): When a role change is executed using DGMGRL, GDS is automatically notified, and it then activates the services that are appropriate for the new database roles.

DGMGRL may be used to add a single database to the Sales configuration even if Sales is a member of the Prod pool (C): DGMGRL provides the capability to manage individual databases within a broker configuration, including adding databases to a configuration that is already part of a GDS pool.

NEW QUESTION # 72

Which THREE are among the various tasks performed by the Data Guard Monitor (DMON) process?

- A. communicating with the DMON process of the observer to monitor a primary database in case a fast start failover is required
- B. performing role transitions when switchover requests are made
- C. communicating with dkon processes in other database instances that are part of the broker configuration
- D. activating role-based services appropriately in the various database instances of the configuration, based on the database role
- E. maintaining information about all members of the broker configuration in binary configuration files.

Answer: B,D,E

Explanation:

The Data Guard Monitor (DMON) process is a key component of Oracle Data Guard. It plays a crucial role in managing and monitoring the state of both the primary and standby databases in a Data Guard configuration.
* Performing role transitions when switchover requests are made (A): DMON is responsible for coordinating the switchover process between the primary and standby databases. This involves safely transitioning the roles of the databases to ensure data protection and availability.
* Maintaining information about all members of the broker configuration in binary configuration files (B): DMON maintains detailed information about the databases in the Data Guard configuration, including their roles, states, and network addresses. This information is stored in binary configuration files, which are used by the Data Guard Broker to manage the Data Guard environment.
* Activating role-based services appropriately in the various database instances of the configuration, based on the database role (C): DMON activates services that are appropriate for the role of each database in the Data Guard configuration. For example, it may activate different services on a primary database than on a standby database, based on the specific requirements of each role.

NEW QUESTION # 73

......

Our top priority is to help every customer in cracking the Oracle Database 19c: Data Guard Administration (1z0-076) test. Therefore, we have created these formats so that every applicant can prepare successfully for the Oracle Database 19c: Data Guard Administration (1z0-076) exam on the first attempt. We are aware that the cost for the registration of the Oracle 1z0-076 examination is not what everyone can pay. After paying the hefty Oracle Database 19c: Data Guard Administration (1z0-076) test registration fee, applicants usually run on a tight budget. This is why Dumpkiller provides you with the Oracle Database 19c: Data Guard Administration (1z0-076) real questions with up to 1 year of free updates.
