## Cisco Supporting Cisco Devices for Field Technicians Sample Questions (Q70-Q75):

### NEW QUESTION # 70

Which function does the Stack Port 1 serve on a Cisco Meraki switch?

- A. It connects to the Stack Port 2 of the next switch in a stack configuration.
- **B. It serves as a high-speed interconnect for clustered switches.**
- C. It connects to the Stack Port 2 of the previous switch in a stack configuration.
- D. It provides a dedicated uplink to the Meraki cloud for management.

**Answer: B**

Explanation:

On Cisco Meraki switches, Stack Port 1 (along with Stack Port 2) is used to form a physical stacking connection between multiple switches. These stack ports are dedicated high-speed interconnects that enable multiple switches to operate as a single logical switch. The stacking topology depends on the number of switches, but Stack Port 1 serves as one side of this high-speed inter-switch communication channel - not for management or cloud access.

### NEW QUESTION # 71

What must be verified before installing or replacing DIMMs in a Cisco UCS server?

- **A. Current DIMM configuration and population order**
- B. Compatibility of the DIMM with the current firmware version of the server
- C. Exact type, speed, and capacity of the DIMM
- D. Maximum supported DIMM capacity for the server model

**Answer: A**

Explanation:

Before installing or replacing DIMMs (Dual In-line Memory Modules) in a Cisco UCS server, it is essential to verify the current DIMM configuration and the population order. Cisco UCS servers have strict memory population rules to ensure optimal performance and compatibility, particularly in relation to memory channels and banks.

While the type, capacity, and firmware compatibility are important, failing to follow the correct population guidelines can result in failed boot processes or suboptimal performance.

### NEW QUESTION # 72

Drag and drop the characteristics from the left onto the corresponding categories of MDS switch on the right.

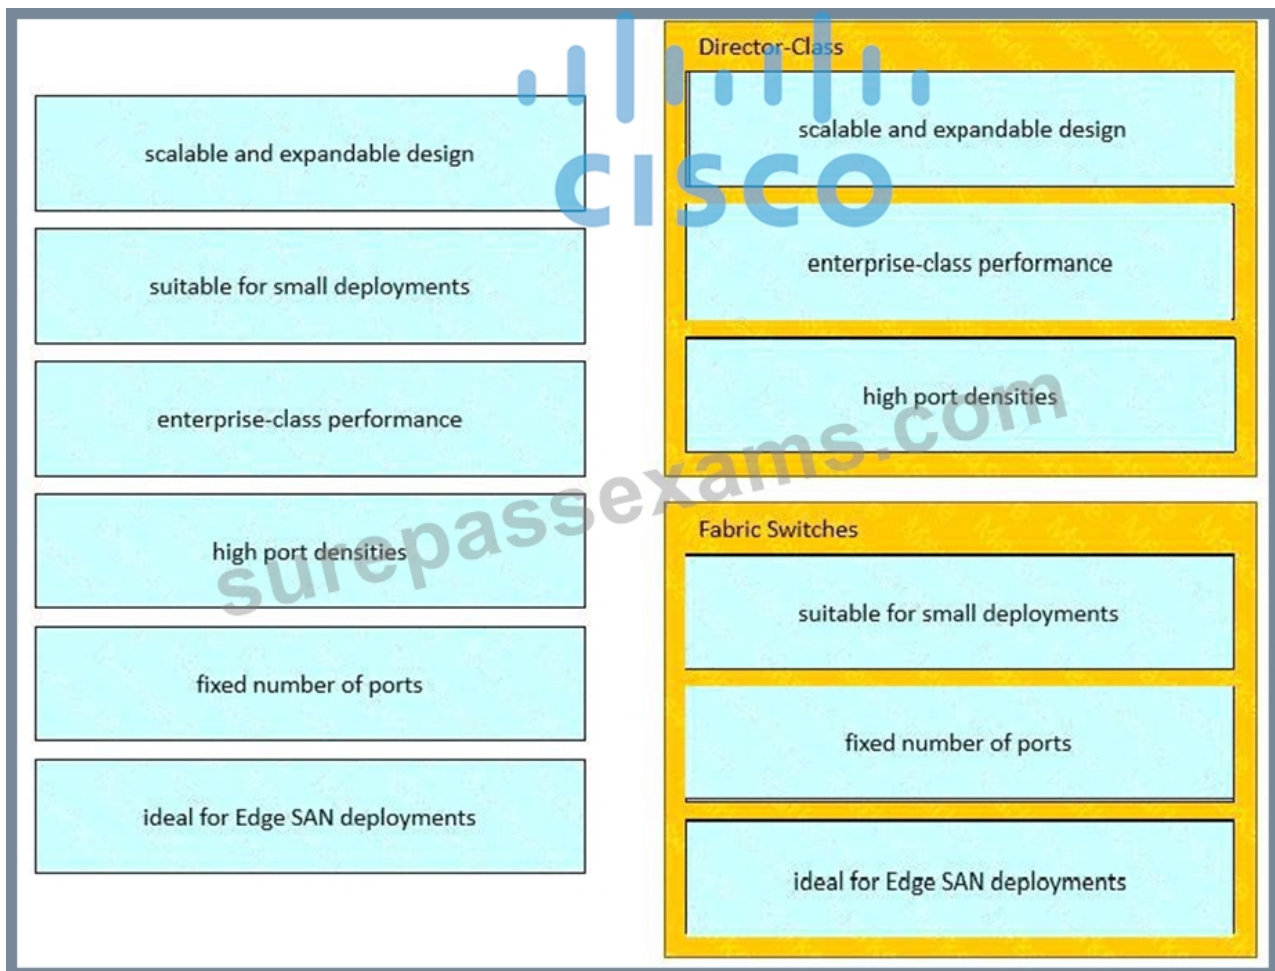

**Answer:**

Explanation:

Explanation:

Cisco MDS switches are segmented into two key categories: Director-Class and Fabric Switches, each tailored for different SAN environments:

Director-Class Switches (e.g., Cisco MDS 9700 Series):

Modular and highly scalable

Support hot-swappable components (line cards, supervisors, fabric modules) High port density and performance for core SANs in enterprise data centers

Fabric Switches (e.g., Cisco MDS 9148T):

Compact, fixed-form factor

Best suited for smaller SANs or edge locations

Cost-effective and simple to deploy

This distinction is important when selecting hardware for data center core vs access layers in SAN architectures.

### NEW QUESTION # 73

Drag and drop the failures from the left onto the responsible devices in the MDS field-replaceable unit on the right.

inability to manage or control switch functions	fan module
failure to maintain optimal temperatures	supervisor module
loss of connectivity on specific ports	fabric module
inability to establish fiber optic connections	line card
degraded internal data transfer between line cards	transceivers

**Answer:**

**Explanation:**

inability to manage or control switch functions	failure to maintain optimal temperatures
failure to maintain optimal temperatures	inability to manage or control switch functions
loss of connectivity on specific ports	degraded internal data transfer between line cards
inability to establish fiber optic connections	loss of connectivity on specific ports
degraded internal data transfer between line cards	inability to establish fiber optic connections

**Explanation:**

Inability to manage or control switch functions # Supervisor module

Failure to maintain optimal temperatures # Fan module

Loss of connectivity on specific ports # Line card

Inability to establish fiber optic connections # Transceivers

Degraded internal data transfer between line cards # Fabric module

From the FLDTEC training materials, Cisco MDS switches are built for high availability and redundancy, but field technicians must

know which component impacts what function:

- \* Supervisor Module: Manages control plane functions - a failure results in loss of system-level management or redundancy.
  - \* Fan Module: Essential for cooling - failure here leads to overheating and thermal alarms.
  - \* Line Card: Provides connectivity - port failures or loss of interface status originate from faulty line cards.
  - \* Transceivers (SFP/QSFP modules): Responsible for optical transmission - failure leads to fiber optic link issues.
  - \* Fabric Module: Critical for switching between line cards - its failure leads to degraded or disrupted internal traffic paths.
- These mappings help technicians isolate the source of faults and proceed with the correct RMA or replacement procedure.

#### NEW QUESTION # 74

Drag and drop the tools from the left onto the corresponding primary functions on the right.

**Answer:**

Explanation:

Explanation:

In the FLDTEC curriculum, technicians are trained on physical tools essential for support in the field. These tools and their uses are explained as follows:

- \* Flash Card Reader: Used with removable CompactFlash cards commonly found in older Cisco routers and switches. These cards hold the IOS image or config files.
- \* USB Thumb Drive: Used for transferring IOS files or configs directly to and from Cisco devices that support USB storage. Convenient for portable backups.
- \* RJ-45 Ethernet Loopback Connector: A diagnostic tool that loops the signal back into the port. Helps verify port functionality by simulating a live Ethernet connection.
- \* RJ-45 Coupler: Allows two patch cables to be connected, effectively extending the reach of a cable - useful in setups where a single cable is not long enough.
