필수입니다.

## 최신 Deep Security Deep-Security-Professional 무료 샘플문제 (Q72-Q77):

### 질문 # 72

An administrator enables Multi-Tenancy in Deep Security and creates multiple tenants. After a period of time, the administrator would like to review the usage and resource consumption by a specific tenant. How can the administrator retrieve this information?

- A. The administrator will not be able retrieve this information without licensing and enabling the Multi-Tenancy Chargeback module in the Deep Security Manager Web console.
- **B. The administrator could generate a Tenant report from within the Deep Security Manager Web console.**
- C. The administrator could check the Multi-Tenancy log file for resource consumption details.
- D. The administrator downloads the Tenant usage details from the Deep Security Agent on the Tenant computer.

정답: B

#### 설명:

Usage and resource consumption for a tenant can be reviewed by generating tenant usage/chargeback reports directly in the Deep Security Manager Web console.

Option A is incorrect; the log file does not contain usage stats.

Option C is incorrect; no extra licensing is required for basic reporting.

Option D is incorrect; usage reports are generated in the manager, not on the agent.

Trend Micro Deep Security Admin Guide: Multi-Tenancy Reporting

### 질문 # 73

Which of the following statements is correct regarding the policy settings displayed in the exhibit?

- A. The Heartbeat interval value displayed in this policy is inherited from the parent policy
- **B. Deep Security Agents using the displayed policy will send event details to Deep Security Manager every 5 minutes.**
- C. All Deep Security Agents will send event details to Deep Security Manager every 5 minutes.
- D. Deep Security Manager will refresh the policy details on the Deep Security Agents using this policy every 5 minutes.

정답: B

#### 설명:

The Heartbeat interval is explicitly set to "5 Minutes" (not inherited, as the drop-down does not show "Inherited" for this field).

Only agents assigned to this specific policy will send heartbeat (event, status, and update information) to Deep Security Manager every 5 minutes.

Option C is incorrect because only agents using this policy will follow this interval, not all agents.

Option D is incorrect; the heartbeat governs communication initiated by the agent, not a policy push by the manager.

Option A is incorrect; it is not inherited.

Trend Micro Deep Security Admin Guide: Agent Heartbeat

Policy Inheritance Explanation

### 질문 # 74

Based on the configuration setting highlighted in the exhibit, what behavior can be expected during a malware scan?

- **A. With the highlighted setting enabled, Deep Security Agents will scan files for viruses and malware using supplementary aggressive detection pattern files.**
- B. With the highlighted setting enabled, Deep Security Agents will scan files for known viruses and malware using patterns and any files deemed suspicious will be submitted to a configured Deep Discovery Analyzer for further analysis.
- C. With the highlighted setting enabled, Deep Security Agents will scan files for unknown malware using Predictive Machine Learning.
- D. With the highlighted setting enabled, Deep Security Agents will scan files for known malware as well as newly encountered malware by accessing the Suspicious Objects List.

정답: A

설명:

The highlighted option specifies, "Scan for exploits against known critical vulnerabilities and aggressive detection of unknown suspicious exploits." This means the agent uses additional, more aggressive detection patterns to identify not just known exploits but also suspicious and unknown exploit techniques in document files. Predictive Machine Learning and Suspicious Objects List are separate features, and Deep Discovery Analyzer integration is not referenced by this setting.

#### 질문 # 75

What is the purpose of the Deep Security Notifier?

- A. The Deep Security Notifier is a server component that collects log entries from managed computers for delivery to a configured SIEM device.
- B. The Deep Security Notifier is a server component used in agentless configurations to allow Deep Security Manager to notify managed computers of pending updates.
- C. The Deep Security Notifier is an application in the Windows System Tray that communicates the state of Deep Security Agents and Relays to endpoint computers.
- D. The Deep Security Notifier is an application in the Windows System Tray that displays the Status of Deep Security Manager during policy and software updates.

정답: C

설명:

The Deep Security Notifier is a lightweight Windows system tray application that communicates the security status and activity of the local Deep Security Agent or Relay to the endpoint user. It provides pop-up notifications for detected threats, agent status, and protection status. It is not a server component and does not display Deep Security Manager status.

From the official documentation:

"Deep Security Notifier is a lightweight Windows system tray application installed alongside the agent, which provides notifications about agent activity, detected threats, and protection status to endpoint users." Option D is correct (official description).

Option A is incorrect: It does not display Deep Security Manager status.

Option B is incorrect: It is not for log collection or SIEM delivery.

Option C is incorrect: Not used for agentless or update notification.

#### 질문 # 76

Multiple Application Control Events are being displayed in Deep Security after a series of application updates and the administrator would like to reset Application Control. How can this be done?

- A. On the Deep Security Agent computer, type the following command to reset Application Control:  
`dsa_control -r`
- B. Click "Clear All" on the Actions tab in the Deep Security Manager Web console to reset the list of Application Control events.
- C. Application Control can be reset by disabling the Protection Module, then enabling it once again. This will cause local rulesets to be rebuilt.
- D. Application Control can not be reset.

정답: C

설명:

\* To reset Application Control in Trend Micro Deep Security, the recommended and official method is to disable the Application Control module and then enable it again for the agent or computer.

\* This process removes the existing application inventory and local rulesets, effectively resetting Application Control. When re-enabled, the module will rebuild its inventory and local rules from scratch.

\* The documentation clearly states:

"If you want to reset Application Control on a computer, disable Application Control for that computer.

When you re-enable Application Control, it removes the inventory and local rules, then rebuilds them from scratch. This is useful after major application upgrades or if the rules become too complex."

\* dsa\_control -ris not an official reset method for Application Control, nor is there a "Clear All" option specifically for this purpose. Option D is incorrect as resets is possible.
