There may be a lot of people feel that the preparation process for exams is hard and boring, and hard work does not necessarily mean good results, which is an important reason why many people are afraid of examinations. Today, our MuleSoft-Integration-Architect-I study materials will radically change this. High question hit rate makes you no longer aimless when preparing for the exam, so you just should review according to the content of our MuleSoft-Integration-Architect-I Study Materials prepared for you. Instant answer feedback allows you to identify your vulnerabilities in a timely manner, so as to make up for your weaknesses.

With all the above merits, the most outstanding one is 100% money back guarantee of your success. Our Salesforce experts deem it impossible to drop the MuleSoft-Integration-Architect-I exam, if you believe that you have learnt the contents of our MuleSoft-Integration-Architect-I study guide and have revised your learning through the MuleSoft-Integration-Architect-I Practice Tests. If you still fail to pass the exam, you can take back your money in full without any deduction. Such bold offer is itself evidence on the excellence of our MuleSoft-Integration-Architect-I study guide and their indispensability for all those who want success without any second thought.

## Exam MuleSoft-Integration-Architect-I Topics | New MuleSoft-Integration-Architect-I Braindumps Files

It is well known that certificates are not versatile, but without a MuleSoft-Integration-Architect-I certification you are a little inferior to the same competitors in many ways. Compared with the people who have the same experience, you will have the different result and treatment if you have a MuleSoft-Integration-Architect-I Certification. Without doubt, you will get a higher salary if you have a MuleSoft-Integration-Architect-I certification or you can enter into a bigger company. And our MuleSoft-Integration-Architect-I exam materials can make your dream come true.

## Salesforce Certified MuleSoft Integration Architect I Sample Questions (Q89-Q94):

**NEW QUESTION # 89**

Refer to the exhibit.

A customer is running Mule applications on Runtime Fabric for Self-Managed Kubernetes (RTF-BYOKS) in a multi-cloud environment.

Based on this configuration, how do Agents and Runtime Manager communicate, and what is exchanged between them?

- A. CPU\_LITE, CPU\_INTENSIVE
- B. BLOCKING\_IO, UBER
- C. UBER, Dedicated NIO Selector Pool
- D. Shared NIO Selector Pool, CPU\_LITE

**Answer: D**

Explanation:

In the context of Mule applications running on Runtime Fabric for Self-Managed Kubernetes (RTF-BYOKS) in a multi-cloud environment, understanding the thread pools used for communication between Agents and Runtime Manager is crucial:

\* Shared NIO Selector Pool: This pool is responsible for handling non-blocking IO operations, such as network communication. It ensures efficient handling of IO operations by using a small number of threads to manage multiple IO tasks simultaneously.

\* CPU\_LITE: This thread pool is used for lightweight CPU operations. It is designed to handle tasks that do not require significant computational resources, ensuring that lightweight operations are processed efficiently without overwhelming the system.

The combination of the Shared NIO Selector Pool and CPU\_LITE thread pool ensures efficient and reliable communication between Agents and Runtime Manager in the RTF environment.

### NEW QUESTION # 90

Organization wants to achieve high availability goal for Mule applications in customer hosted runtime plane.

Due to the complexity involved, data cannot be shared among of different instances of same Mule application.

What option best suits to this requirement considering high availability is very much critical to the organization?

- A. Use third party product to implement load balancer
- B. High availability can be achieved only in CloudHub
- C. The cluster can be configured
- D. Use persistent object store

**Answer: A**

Explanation:

High availability is about up-time of your application

A) High availability can be achieved only in CloudHub isn't correct statement. It can be achieved in customer hosted runtime planes as well B) An object store is a facility for storing objects in or across Mule applications. Mule runtime engine (Mule) uses object stores to persist data for eventual retrieval. It can be used for disaster recovery but not for High Availability. Using object store can't

guarantee that all instances won't go down at once. So not an appropriate choice.

Reference: <https://docs.mulesoft.com/mule-runtime/4.3/mule-object-stores> C) High availability can be achieved by below two models for on-premise MuleSoft implementations.

1) Mule Clustering - Where multiple Mule servers are available within the same cluster environment and the routing of requests will

be done by the load balancer. A cluster is a set of up to eight servers that act as a single deployment target and high-availability processing unit. Application instances in a cluster are aware of each other, share common information, and synchronize statuses. If one server fails, another server takes over processing applications. A cluster can run multiple applications. (refer left half of the diagram) In given scenario, it's mentioned that 'data cannot be shared among of different instances'. So this is not a correct choice. Reference: <https://docs.mulesoft.com/runtime-manager/cluster-about>

2) Load balanced standalone Mule instances - The high availability can be achieved even without cluster, with the usage of third party load balancer pointing requests to different Mule servers. This approach does not share or synchronize data between Mule runtimes. Also high availability achieved as load balanced algorithms can be implemented using external load balancer. (refer right half of the diagram)

### NEW QUESTION # 91

A customer wants to use the mapped diagnostic context (MDC) and logging variables to enrich its logging and improve tracking by providing more context in the logs.

The customer also wants to improve the throughput and lower the latency of message processing.

As an Mulesoft integration architect can you advise, what should the customer implement to meet these requirements?

- A. Use async logger at the level greater than INFO and use pattern layout with [%MDC] in the log4j2.xml configuration file and then configure the logging variables
- B. Use async logger at the level equal to DEBUG or TRACE and use pattern layout with [%MDC] in the log4j2.xml configuration file and then configure the logging variables
- C. Use synchronous logging at the INFO, DEBUG or TRACE level and use pattern layout with [%MDC] in the log4j2.xml configuration file and then configure the logging variables
- D. Use synchronous logging and use pattern layout with [%MDC] in the log4j2.xml configuration file and then configure the logging variables

**Answer: A**

### NEW QUESTION # 92

Additional nodes are being added to an existing customer-hosted Mule runtime cluster to improve performance. Mule applications deployed to this cluster are invoked by API clients through a load balancer.

What is also required to carry out this change?

- A. External monitoring tools or log aggregators must be configured to recognize the new nodes
- B. API implementations using an object store must be adjusted to recognize the new nodes and persist to them
- C. A new load balancer must be provisioned to allow traffic to the new nodes in a round-robin fashion
- D. New firewall rules must be configured to accommodate communication between API clients and the new nodes

**Answer: A**

Explanation:

\* Clustering is a group of servers or mule runtime which acts as a single unit.

\* Mulesoft Enterprise Edition supports scalable clustering to provide high availability for the Mulesoft application.

\* In simple terms, virtual servers composed of multiple nodes and they communicate and share information through a distributed shared memory grid.

\* By default, Mulesoft ensures the High availability of applications if clustering is implemented.

\* Let's consider the scenario one of the nodes in cluster crashed or goes down and under maintenance. In such cases, Mulesoft will ensure that requests are processed by other nodes in the cluster. Mulesoft clustering also ensures that the request is load balanced between all the nodes in a cluster.

\* Clustering is only supported by on-premise Mule runtime and it is not supported in Cloudhub.

Correct answer is External monitoring tools or log aggregators must be configured to recognize the new nodes

\* Rest of the options are automatically taken care of when a new node is added in cluster.

### NEW QUESTION # 93

Refer to the exhibit.

What is the type data format shown in the exhibit?

- A. YAML
- B. XML
- C. CSV
- D. JSON

**Answer: A**

Explanation:

The data format shown in the exhibit is YAML (YAML Ain't Markup Language). YAML is a human- readable data serialization standard that is commonly used for configuration files and data exchange between languages with different data structures. In the exhibit, the indentation and the use of colons to define key- value pairs are characteristic of YAML.

JSON (JavaScript Object Notation) and XML (eXtensible Markup Language) have different syntax structures, and CSV (Comma-Separated Values) is a flat file format that uses commas to separate values. The format shown in the exhibit fits the structure and style of YAML.

## NEW QUESTION # 94

.....

Don't you want to make a splendid achievement in your career? Certainly hope so. Then it is necessary to constantly improve yourself. Working in the Salesforce industry, what should you do to improve yourself? In fact, it is a good method to improve yourself by taking Salesforce certification exams and getting Salesforce certificate. Salesforce certificate is very important certificate, so more and more people choose to attend MuleSoft-Integration-Architect-I Certification Exam.
