

Quiz 2026 IICRC WRT: Water Damage Restoration Technician (WRT)–Reliable Exam Quick Prep

We provide Water Damage Restoration Technician (WRT) WRT web-based self-assessment practice software that will help you to prepare for the WRT certification exam. Water Damage Restoration Technician (WRT) WRT Web-based software offers computer-based assessment solutions to help you automate the IICRC WRT exam testing procedure. The stylish and user-friendly interface works with all browsers, including Google Chrome, Opera, Safari, and Internet Explorer. It will make your certification exam preparation simple, quick, and smart. So, rest certain that you will discover all you need to study for and pass the Water Damage Restoration Technician (WRT) WRT Exam on the first try.

Once we have latest version, we will send it to your mailbox as soon as possible. our WRT exam questions just need students to spend 20 to 30 hours practicing on the platform which provides simulation problems, can let them have the confidence to pass the WRT exam, so little time great convenience for some workers. Our WRT question torrent not only have reasonable price but also can support practice perfectly, as well as in the update to facilitate instant upgrade for the users in the first place, compared with other education platform on the market, the WRT Exam Question can be said to have high quality performance. It must be your best tool to pass your exam and achieve your target.

IICRC Water Damage Restoration Technician (WRT) Sample Questions (Q35-Q40):

NEW QUESTION # 35

What should a technician do in a Category 3 water intrusion when high-risk individuals are present?

- **A. Retain an Indoor Environmental Professional (IEP)**
- B. Be primarily concerned with the dehumidifier's AHAM rating
- C. Always perform a mold test to verify remediation effectiveness
- D. Install additional air movers and dehumidifiers

Answer: A

Explanation:

The IICRC WRT body of knowledge states that when high-risk individuals (such as the elderly, infants, immunocompromised persons, or those with respiratory conditions) are present during a Category 3 water intrusion, an Indoor Environmental Professional (IEP) should be retained.

Category 3 water is grossly contaminated and poses significant health risks. The WRT manual explains that an IEP provides independent assessment, sampling strategies, and recommendations to protect occupant health and guide appropriate remediation decisions.

Increasing equipment or focusing on AHAM ratings does not address health risk evaluation. Mold testing is not automatically required and may not be appropriate during active mitigation.

Retaining an IEP ensures objective decision-making, regulatory alignment, and enhanced protection for vulnerable occupants, consistent with IICRC guidance.

NEW QUESTION # 36

When should carpet cushion (pad, underlay) be removed and discarded?

- A. If it is a synthetic felt cushion
- B. If it is installed over plywood subflooring
- **C. If it is affected with Category 2 or Category 3 water**
- D. If it has a porous membrane or "skin"

Answer: C

Explanation:

The IICRC WRT body of knowledge states that carpet cushion (pad, underlay) must be removed and discarded when affected by Category 2 or Category 3 water. Carpet cushion is a porous material that readily absorbs and retains contaminants, making effective cleaning and decontamination impractical under these conditions.

The WRT manual explains that even if the overlying carpet may be cleanable in some situations, cushion acts like a sponge and can harbor microorganisms, nutrients, and moisture deep within its structure. Attempting to dry or disinfect contaminated cushion poses a health risk and increases the likelihood of secondary damage or odor problems.

While certain cushion types (such as synthetic felt or cushions with skins) influence restorability in Category 1 losses, contamination level takes precedence. The presence of Category 2 or 3 water alone is sufficient to require removal, regardless of cushion construction or subfloor type.

This guidance reflects the WRT emphasis on protecting occupant health and preventing hidden contamination. Removing and discarding contaminated cushion is considered the appropriate and defensible standard of care.

NEW QUESTION # 37

In order to effectively dry subflooring installed below sheet vinyl flooring, what should a restorer typically do?

- A. Perforate and dry the vinyl surface
- B. Place an air mover under one corner
- C. Leave extra drying equipment
- **D. Remove and discard the vinyl**

Answer: D

Explanation:

The IICRC WRT body of knowledge explains that sheet vinyl flooring acts as a vapor barrier, significantly restricting moisture vapor movement from the subfloor beneath it. Because evaporation is inhibited, subflooring beneath vinyl cannot be effectively dried while the covering remains intact.

As a result, the WRT manual states that the most effective and reliable method is to remove and discard the vinyl flooring to allow

direct access for drying. This enables airflow, temperature control, and dehumidification to act directly on the wet subfloor. Perforating vinyl is unreliable and may cause additional damage without ensuring adequate vapor release. Placing an air mover at an edge does not overcome the vapor barrier effect. Simply adding equipment without removing the barrier does not resolve the drying limitation. Removing vinyl aligns with the WRT principle that vapor barriers must be addressed to achieve effective drying and prevent hidden moisture from causing secondary damage.

NEW QUESTION # 38

What may a restorer consider when the outside humidity ratio is significantly lower than indoors, and the temperature is equal to or higher than indoors?

- A. Increase indoor humidity
- B. Decreased evaporation
- C. A closed drying system
- **D. An open drying system**

Answer: D

Explanation:

The IICRC WRT body of knowledge explains that when outdoor humidity ratio is significantly lower than indoor humidity ratio, and outdoor temperature is equal to or higher than indoor temperature, a restorer may consider using an open drying system. An open drying system introduces outside air to replace moist indoor air, reducing the indoor humidity ratio and vapor pressure. When the incoming air is warmer and drier, it enhances evaporation and supports moisture removal without relying solely on mechanical dehumidification. The WRT manual stresses that ventilation decisions must be based on psychrometric comparison-not assumptions about comfort. Using outside air under favorable conditions can be energy-efficient and effective, but only when conditions are continuously monitored. A closed system would be counterproductive in this scenario, as it would trap higher-moisture air inside the drying chamber. Increasing indoor humidity or expecting reduced evaporation contradicts drying physics.

NEW QUESTION # 39

What steps should be taken to minimize safety concerns with sagging gypsum board ceilings and promote rapid drying?

- A. Support to prevent collapse while drying
- **B. Drain, safely remove, and properly dispose**
- C. Drain, properly dry the gypsum, and reinstall
- D. Perforate to increase airflow while drying

Answer: B

Explanation:

The IICRC WRT body of knowledge identifies sagging gypsum board ceilings as a serious structural and safety hazard. Gypsum board loses strength when wet, especially in horizontal installations, and sagging indicates primary damage that cannot be safely reversed. The WRT manual clearly states that wet gypsum ceilings presenting sagging or collapse risk must be drained, safely removed, and properly disposed of. Attempting to dry sagging ceiling drywall in place is unsafe and inconsistent with professional standards. Perforation or temporary support does not restore structural integrity and exposes workers and occupants to collapse hazards. Reinstallation is only appropriate after damaged materials are removed and the structure is dried. This guidance reinforces the WRT principle that life safety always overrides salvage considerations. Removing compromised ceiling drywall eliminates hazards and allows drying equipment to operate more effectively on remaining structural components.
