Juniper Junos, Associate (JNCIA-Junos) Sample Questions (Q100-Q105):

NEW QUESTION # 100
Exhibit.

Referring to the exhibit, which routing configuration is required for these two users to access the remote server?

- A. Trunk ports must be enabled on the switch.
- B. Users must connect directly to the router.
- C. A routing protocol must be enabled on the router.
- D. Users and the server require a default gateway.

Answer: D

Explanation:
For the users in the 10.1.1.0/24 subnet and the server in the 10.1.2.0/24 subnet to communicate with each other, they need to route packets through the router that connects these two subnets. Each user and the server need to have their default gateway set to the IP address of the router interface on their respective subnet (.254). This ensures that packets destined for other subnets are sent to the router, which then routes them to the correct destination subnet.

NEW QUESTION # 101
Which Junos feature limits the amount of exception traffic that is sent from the PFE to the RE?

- A. routing policy
- B. policer
- C. CoS markings
- D. scheduler

Answer: B

Explanation:
In Junos OS, a policer is a feature used to limit the rate of traffic flow in the network, including exception traffic sent from the Packet Forwarding Engine (PFE) to the Routing Engine (RE). Exception traffic consists of packets that cannot be processed by the PFE alone and require intervention by the RE, such as control packets or packets destined for the device itself. A policer can be configured to enforce bandwidth limits and drop or mark packets that exceed specified rate limits, thus protecting the RE from being overwhelmed by excessive exception traffic.

NEW QUESTION # 102
Which layer of the OSI model contains the IP address information?

- A. Layer 2
- B. Layer 4
- C. Layer 1
- D. Layer 3

Answer: D

Explanation:
The OSI (Open Systems Interconnection) model is a conceptual framework used to understand network interactions in seven distinct layers. IP (Internet Protocol) addresses are part of Layer 3, known as the Network Layer. This layer is responsible for packet forwarding, including routing through intermediate routers, and it handles the logical addressing scheme of the network to ensure that packets can be routed across multiple networks and reach their destination. IP addresses provide unique identifiers for

network interfaces, allowing for communication between devices on a network or across different networks.

NEW QUESTION # 103

What information would you find using the CLI help command?

- A. message of the day
- B. an explanation for specific system log error messages
- C. a URL for accessing the technical documentation
- D. hyperlinks for remediation actions

Answer: B

Explanation:
The CLI help command in Junos OS provides assistance and explanations for commands, command options, and in some cases, specific system log error messages. By using the help command followed by specific keywords or messages, users can get detailed information and context for the commands they are using or errors they are encountering. This feature is particularly useful for understanding the purpose of commands, their syntax, and troubleshooting error messages that may appear in system logs.

NEW QUESTION # 104

How many rescue configuration files are supported on a Junos device?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: A

Explanation:
Junos OS supports only 1 rescue configuration file on a device. This rescue configuration is a safeguard feature that allows network administrators to revert to a known good configuration in case of a configuration error or issue, ensuring network stability.
In Junos OS, each device supports only one rescue configuration file. The rescue configuration is a specific configuration that can be saved and later retrieved if needed. This is used as a fallback configuration that you know works and can be applied in case of an emergency or if the current configuration has issues.
Reference:
"You can create a rescue configuration file by using the request system configuration rescue save operational mode command. Each Junos OS device can have only one rescue configuration file."
NEW QUESTION # 105
