## D-PWF-OE-00최신 업데이트버전 인증덤프 - D-PWF-OE-00최신 인증시험 정보

최근 IT 업종에 종사하는 분들이 점점 늘어가는 추세하에 경쟁이 점점 치열해지고 있습니다. IT인증시험은 국제에서 인정받는 효력있는 자격증을 취득하는 과정으로서 널리 알려져 있습니다. Itcertkr의 EMC인증 D-PWF-OE-00덤프는 IT인증시험의 한 과목인 EMC인증 D-PWF-OE-00시험에 대비하여 만들어진 시험전 공부자료인데 높은 시험적 중율과 친근한 가격으로 많은 사랑을 받고 있습니다.

### 최신 Converged Infrastructure D-PWF-OE-00 무료샘플문제 (Q77-Q82):

#### 질문 # 77

Which actions ensure secure alert configurations in PowerFlex? (Choose two).

- A. Validate SNMP trap destinations
- B. Enable role-based access control for alerts
- C. Assign alerts to metadata managers
- D. Configure email notifications for critical events

정답: A,D

#### 설명:

Configuring alerts ensures that administrators are notified of security or health issues promptly.

\* Validate SNMP trap destinations (Option A): PowerFlex can send SNMP traps to a central monitoring station (like Nagios, SolarWinds, or Secureworks). Validating these destinations ensures that sensitive alert data is being sent to authorized, secure servers and not leaked to unauthorized IPs.

\* Configure email notifications for critical events (Option B): Configuring an SMTP gateway allows PowerFlex to email administrators immediately when a "Critical" or "Error" event occurs (e.g., "Drive Failed" or "Login Failed"). Ensuring this channel is encrypted (TLS) and directed to the correct distribution lists is part of a secure configuration.

#### 질문 # 78

Which component is responsible for data aggregation and storage management in PowerFlex?

- A. Meta Data Manager
- B. Storage Data Server
- C. Fault Set
- D. Protection Domain

정답: B

#### 설명:

While the MDM manages the configuration, the Storage Data Server (SDS) is the component responsible for the actual aggregation of raw storage and the management of data persistence.

\* Role of SDS: The SDS software runs on every node that contributes storage. It takes ownership of the local physical drives (NVMe, SSD, HDD), aggregates them, and presents them as part of a Storage Pool.

\* Data Handling: The SDS performs the heavy lifting of writing data to disk, reading data for clients (SDCs), and ensuring data consistency. It manages the "Mesh Mirroring" by communicating with other SDSs to replicate chunks of data. Without the SDS, the physical drives are just isolated disks; the SDS aggregates them into a cohesive software-defined storage layer.

#### 질문 # 79

While setting up a PowerFlex cluster, an administrator needs to create a Storage Pool. What tasks must they complete first?

- A. Configure a Protection Domain
- B. Enable Fault Sets for redundancy
- C. Assign drives with consistent performance metrics
- D. Validate VLAN configurations

정답: A

**설명:**

This question tests your knowledge of the logical hierarchy in PowerFlex:

System  $\rightarrow$  Protection Domain  $\rightarrow$  Storage Pool  $\rightarrow$  Device (Disk)  
 $\rightarrow$  Volume.

\* Configure a Protection Domain (Option A): You cannot create a Storage Pool without a parent entity. The Protection Domain (PD) is the container that isolates a specific group of nodes. Once the PD is created, you create a Storage Pool inside it.

\* The Workflow:

\* Install SDS software on nodes.

\* Create a Protection Domain (e.g., PD\_1).

\* Add SDS nodes to PD\_1.

\* Create a Storage Pool (e.g., Pool\_SSD) inside PD\_1.

\* Add devices (drives) to Pool\_SSD.

Options B and C are important validation steps, but A is the mandatory structural prerequisite.

**질문 # 80**

What is the minimum bandwidth requirement for replicating volumes between PowerFlex clusters?

- A. 100 Mbps
- B. 10 Gbps
- C. 1 Gbps
- D. 10 Mbps

**정답: A**

**설명:**

\* 100 Mbps: While PowerFlex replication is highly efficient and only sends unique data chunks (deltas), the supported minimum reliable bandwidth for a WAN link between clusters is typically 100 Mbps.

\* Reasoning: Below this speed, even moderate change rates in a production database would likely cause the replication journal to fill up faster than data can be drained to the remote site. This would lead to a

"Buffer Full" state, causing the replication to pause or the system to lose its Recovery Point Objective (RPO) compliance.

**질문 # 81**

What is the minimum number of nodes required to create a Storage Data Server (SDS)?

- A. 0
- B. 1
- C. 2
- D. 3

**정답: C**

**설명:**

\* 3 Nodes: While you can technically install the SDS software on a single server, to create a functioning Storage Pool and a valid PowerFlex cluster that supports the standard 2-copy mesh-mirroring protection scheme, a minimum of 3 SDS nodes is required.

\* Why? Data is divided into chunks (Primary and Secondary).

\* Chunk A Primary goes to Node 1.

\* Chunk A Secondary goes to Node 2.

\* If Node 1 fails, the system needs a third node (Node 3) to rebuild the missing copy from Node 2 to restore redundancy. A 2-node cluster cannot rebuild data if one node fails (nowhere to put the copy), leaving it permanently degraded.
