Microsoft GitHub Advanced Security Sample Questions (Q25-Q30):

NEW QUESTION # 25
In a private repository, what minimum requirements does GitHub need to generate a dependency graph? (Each answer presents part of the solution. Choose two.)

- A. Read-only access to all the repository's files
- B. Read-only access to the dependency manifest and lock files for a repository

- C. Write access to the dependency manifest and lock files for an enterprise
- D. Dependency graph enabled at the organization level for all new private repositories

Answer: B,D

Explanation:
Comprehensive and Detailed Explanation:
To generate a dependency graph for a private repository, GitHub requires:
Dependency graph enabled: The repository must have the dependency graph feature enabled. This can be configured at the organization level to apply to all new private repositories.
Access to manifest and lock files: GitHub needs read-only access to the repository's dependency manifest and lock files (e.g., package.json, requirements.txt) to identify and map dependencies.

NEW QUESTION # 26
You are managing code scanning alerts for your repository. You receive an alert highlighting a problem with data flow. What do you click for additional context on the alert?

- A. Security
- B. Code scanning alerts
- C. Show paths

Answer: C

Explanation:
When dealing with a data flow issue in a code scanning alert, clicking on "Show paths" provides a detailed view of the data's journey through the code. This includes the source of the data, the path it takes, and where it ends up (the sink). This information is crucial for understanding how untrusted data might reach sensitive parts of your application and helps in identifying where to implement proper validation or sanitization.

NEW QUESTION # 27
What is the first step you should take to fix an alert in secret scanning?

- A. Remove the secret in a commit to the main branch.
- B. Archive the repository.
- C. Revoke the alert if the secret is still valid.
- D. Update your dependencies.

Answer: C

Explanation:
The first step when you receive a secret scanning alert is to revoke the secret if it is still valid. This ensures the secret can no longer be used maliciously. Only after revoking it should you proceed to remove it from the code history and apply other mitigation steps. Simply deleting the secret from the code does not remove the risk if it hasn't been revoked - especially since it may already be exposed in commit history.

NEW QUESTION # 28
What YAML syntax do you use to exclude certain files from secret scanning?

- A. secret scanning.yml
- B. paths-ignore:
- C. decrypt_secret.sh
- D. branches-ignore:

Answer: B

Explanation:
To exclude specific files or directories from being scanned by secret scanning in GitHub Actions, you can use the paths-ignore: key within your YAML workflow file.

This tells GitHub to ignore specified paths when scanning for secrets, which can be useful for excluding test data or non-sensitive mock content.

Other options listed are invalid:

branches-ignore: excludes branches, not files.

decrypt_secret.sh is not a YAML key.

secret scanning.yml is not a recognized filename for configuration.

NEW QUESTION # 29

How do I configure a webhook to monitor key scan alert events? What are the steps of this operation?

- A. Enable system for cross-domain identity management (SCIM) provisioning for the enterprise.
- B. Dismiss alerts that are older than 90 days.
- C. Document alternatives to storing secrets in the source code.
- D. Configure a webhook to monitor for secret scanning alert events.

Answer: C,D

Explanation:

To proactively address secret scanning:

Webhooks can be configured to listen for secret scanning events. This allows automation, logging, or alerting in real-time when secrets are detected.

Documenting secure development practices (like using environment variables or secret managers) helps reduce the likelihood of developers committing secrets in the first place.

Dismissal based on age is not a best practice without triage. SCIM deals with user provisioning, not scanning alerts.
