## Amazon AWS Certified Security - Specialty Sample Questions (Q214-Q219):

#### NEW QUESTION # 214

A security engineer is implementing a solution to allow users to seamlessly encrypt Amazon S3 objects without having to touch the keys directly. The solution must be highly scalable without requiring continual management. Additionally, the organization must be able to immediately delete the encryption keys.

Which solution meets these requirements?

- A. Use the Systems Manager Parameter Store to store the keys and then use the service API operations to delete the keys if necessary.
- B. Use AWS KMS with AWS managed keys and the ScheduleKeyDeletion API with a PendingWindowInDays set to 0 to remove the keys if necessary.
- C. Use AWS CloudHSM to store the keys and then use the CloudHSM API or the PKCS11 library to delete the keys if necessary.
- D. Use KMS with AWS imported key material and then use the DeleteImportedKeyMaterial API to remove the key material if necessary.

**Answer: B**

#### NEW QUESTION # 215

A company wants to know when users make changes to IAM roles in the company's AWS account. The company uses Amazon CloudWatch and AWS CloudTrail in the account. The company has configured a CloudTrail trail to capture read and write API activity for management events. The company has an Amazon Simple Notification Service (Amazon SNS) topic for security notifications.

A security engineer must implement a solution that provides a notification when an IAM role is edited.

Which solution will meet this requirement?

- A. Create an Amazon EventBridge rule that monitors AWS API calls from CloudTrail. Scope the event pattern to monitor changes to IAM roles from the `iam.amazonaws.com` event source. Set the SNS topic as the target of the EventBridge rule.
- B. Create a new CloudWatch log group. Configure the CloudTrail trail to send events to the new log group. Set up a CloudWatch metric to monitor changes to IAM roles from the `iam.amazonaws.com` event source. Create a subscription filter for the log group. Set the SNS topic as the target of the subscription filter.
- C. Enable Amazon Detective. Run a Detective investigation for changes to IAM roles. Create an Amazon EventBridge rule that monitors the results of the Detective investigation. Set the SNS topic as the target of the EventBridge rule.
- D. Create a new CloudWatch log group. Configure the CloudTrail trail to send events to the new log group. Create a subscription filter that includes an event pattern to monitor changes to IAM roles from the `iam.amazonaws.com` event source. Set the SNS topic as the target of the subscription filter.

**Answer: A**

#### NEW QUESTION # 216

A company is deploying an Amazon EC2-based application. The application will include a custom health- checking component that produces health status data in format. A Security Engineer must implement a secure solution to monitor application availability in near-real time by analyzing the hearth status data.

Which approach should the Security Engineer use?

- A. Use Amazon CloudWatch monitoring to capture Amazon EC2 and networking metrics. Visualize metrics using Amazon CloudWatch dashboards.
- B. Run the Amazon Kinesis Agent to write the status data to Amazon Kinesis Data Firehose. Store the streaming data from Kinesis Data Firehose in Amazon Redshift. Then run a script on the pool data and analyze the data in Amazon Redshift.
- C. Write the status data directly to a public Amazon S3 bucket from the health-checking component. Configure S3 events to invoke an IAM Lambda function that analyzes the data.
- D. Generate events from the health-checking component and send them to Amazon CloudWatch Events. Include the status data as event payloads. Use CloudWatch Events rules to invoke an IAM Lambda function that analyzes the data.

**Answer: A**

Explanation:

Amazon CloudWatch monitoring is a service that collects and tracks metrics from AWS resources and applications, and provides visualization tools and alarms to monitor performance and availability<sup>1</sup>. The health status data in format can be sent to CloudWatch as custom metrics<sup>2</sup>, and then displayed in CloudWatch dashboards<sup>3</sup>. The other options are either inefficient or insecure for

monitoring application availability in near- real time.

### NEW QUESTION # 217

A security engineer is configuring account-based access control (ABAC) to allow only specific principals to put objects into an Amazon S3 bucket. The principals already have access to Amazon S3.

The security engineer needs to configure a bucket policy that allows principals to put objects into the S3 bucket only if the value of the Team tag on the object matches the value of the Team tag that is associated with the principal. During testing, the security engineer notices that a principal can still put objects into the S3 bucket when the tag values do not match.

Which combination of factors are causing the PutObject operation to succeed when the tag values are different? (Choose two.)

- A. The principal's identity-based policy grants access to put objects into the S3 bucket with no conditions.
- B. The principal's identity-based policy overrides the condition because the identity-based policy contains an explicit allow.
- C. The S3 bucket's resource policy does not deny access to put objects.
- D. The S3 bucket's resource policy cannot allow actions to the principal.
- E. The bucket policy does not apply to principals in the same zone of trust.

**Answer: A,C**

### NEW QUESTION # 218

A company has recently recovered from a security incident that required the restoration of Amazon EC2 instances from snapshots. The company uses an AWS Key Management Service (AWS KMS) customer managed key to encrypt all Amazon Elastic Block Store (Amazon EBS) snapshots.

The company performs a gap analysis of its disaster recovery procedures and backup strategies. A security engineer needs to implement a solution so that the company can recover the EC2 instances if the AWS account is compromised and the EBS snapshots are deleted.

Which solution will meet this requirement?

- A. Create a new Amazon S3 bucket. Use EBS lifecycle policies to move EBS snapshots to the new S3 bucket. Use lifecycle policies to move snapshots to the S3 Glacier Instant Retrieval storage class. Use S3 Object Lock to prevent deletion of the snapshots.
- B. Use AWS Systems Manager to distribute a configuration that backs up all attached disks to Amazon S3.
- C. Create a new AWS account that has limited privileges. Allow the new account to access the KMS key that encrypts the EBS snapshots. Copy the encrypted snapshots to the new account on a recurring basis.
- D. Use AWS Backup to copy EBS snapshots to Amazon S3. Use S3 Object Lock to prevent deletion of the snapshots.

**Answer: C**
