

Free CTFL-AT Brain Dumps, CTFL-AT Valid Cram Materials

BONUS!!! Download part of SureTorrent CTFL-AT dumps for free: https://drive.google.com/open?id=1wA6NKLXLYv8mr_z4fsqvtNXKa4bzbq2zs

You can enjoy free update for 365 days if you buying CTFL-AT study guide of us, that is to say, in the following year you can obtain the latest information for the exam timely. And the update version for CTFL-AT exam dumps will be sent to your email automatically. You just need to receive and exchange your learning ways in accordance with the new changes. In addition, CTFL-AT Study Materials are compiled by experienced experts, and they are quite familiar with the exam center, therefore the quality can be guaranteed. We also have online and offline chat service, if you have any questions about CTFL-AT exam dumps, you can consult us.

For one thing, the most advanced operation system in our company which can assure you the fastest delivery speed on our CTFL-AT exam questions, and your personal information will be encrypted automatically by our operation system. For another thing, with our CTFL-AT actual exam, you can just feel free to practice the questions in our training materials on all kinds of electronic devices. In addition, under the help of our CTFL-AT Exam Questions, the pass rate among our customers has reached as high as 98% to 100%. We are look forward to become your learning partner in the near future.

Quiz ISQI CTFL-AT Marvelous Free Brain Dumps

All contents are masterpieces from experts who imparted essence of the exam into our CTFL-AT practice materials. So our high quality and high efficiency CTFL-AT practice materials conciliate wide acceptance around the world. By incubating all useful content CTFL-AT practice materials get passing rate from former exam candidates of 98 which evince our accuracy rate and proficiency. If your problems are divulging during the review you can pick out the difficult one and focus on those parts.

ISQI ISTQB Certified Tester - Foundation Level Extension - Agile Tester Sample Questions (Q42-Q47):

NEW QUESTION # 42

You are working on an Agile project and have been asked to implement exploratory testing for the current sprint. Which one of the following is a correct approach to adopt?

- A. Ask experienced testers to prepare test charters for time boxed sessions lasting no more than 2hours. Tests should be designed and executed within each session using heuristics, creativity and intuition.
- B. Ask experienced testers to try and find new defects by using the system without the constraint of documentation and tools.
- C. Allocate independent testers to design exploratory tests using test charters in time boxed sessions. Plan to run all sessions in parallel with each session lasting more than 5hours.
- D. Use testers who have not been involved in the sprint to write new test cases from the user stories. These test cases are then executed in a time boxed session for the sprint.

Answer: A

Explanation:

Exploratory testing is a testing approach that emphasizes learning, creativity, and adaptability. It involves simultaneous test design and test execution, where the tester uses heuristics, intuition, and experience to explore the system under test and discover new information¹². Exploratory testing can be performed in an Agile project to complement other testing activities, such as test-driven development, behavior-driven development, and acceptance test-driven development¹².

The correct approach to adopt for exploratory testing in an Agile project is D, as it follows the best practices for exploratory testing¹²³⁴:

* Ask experienced testers to prepare test charters for time boxed sessions lasting no more than 2 hours: A test charter is a brief document that describes the scope, objective, and strategy of an exploratory testing session. A test charter helps to guide the tester's exploration and to document the results. A time box is a fixed period of time allocated for an exploratory testing session. A time box helps to focus the tester's attention and to limit the scope of exploration. A time box should not be too long, as it may reduce the tester's concentration and creativity. A recommended duration for a time box is between 45 minutes and 2 hours.

* Tests should be designed and executed within each session using heuristics, creativity and intuition:

Exploratory testing is an iterative and interactive process, where the tester designs and executes tests based on the observations and feedback from the system under test. The tester uses heuristics, which are rules of thumb or shortcuts that help to simplify the testing problem and to generate test ideas. The tester also uses creativity and intuition, which are mental abilities that help to generate novel and useful solutions and to make judgments based on incomplete or uncertain information.

The incorrect approaches to adopt for exploratory testing in an Agile project are A, B, and C, as they violate the principles and practices of exploratory testing¹²³⁴:

* A: Allocate independent testers to design exploratory tests using test charters in time boxed sessions.

Plan to run all sessions in parallel with each session lasting more than 5 hours: This approach is incorrect because it does not involve simultaneous test design and test execution, which is the essence of exploratory testing. It also uses too long time boxes, which may reduce the tester's concentration and creativity. It also does not leverage the collaboration and communication within the Agile team, as it isolates the testers from the developers and other stakeholders.

* B: Ask experienced testers to try and find new defects by using the system without the constraint of documentation and tools: This approach is incorrect because it does not use test charters, which are essential for guiding and documenting the exploratory testing sessions. It also does not use heuristics, creativity, and intuition, which are important for generating test ideas and making decisions. It also implies that exploratory testing is an unstructured and random activity, which is a common misconception. Exploratory testing is a disciplined and systematic approach that requires planning, analysis, and evaluation.

* C: Use testers who have not been involved in the sprint to write new test cases from the user stories.

These test cases are then executed in a time boxed session for the sprint: This approach is incorrect because it does not involve simultaneous test design and test execution, which is the essence of exploratory testing. It also uses testers who have not been involved in the sprint, which may reduce their understanding of the system under test and the customer needs. It also does not use test charters, which are essential for guiding and documenting the exploratory testing sessions. It also does not use heuristics, creativity, and intuition, which are important for generating test ideas and making decisions.

NEW QUESTION # 43

Which of the following statements about test-driven development (TDD) and behavior-driven development (BDD) is true?

- A. Both BDD tests and TDD tests are written primarily at the acceptance level, though these tests may also be written at the integration or system levels
- **B. TDD tests are focused on the implementation of the software while BDD tests on the exhibited behavior of the software**
- C. TDD tests and BDD tests are written by developers, but TDD tests are generally easier for other team members and stakeholders to understand than BDD tests
- D. Specific BDD frameworks can be used to define acceptance criteria based on the role/feature/benefit template ("As a..., I want..., so that...")

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

From CTFL-AT Syllabus v4.0, Section 3.3 Behavior-Driven Development, and 3.2 Test-Driven Development:

"TDD focuses on writing unit tests that guide the implementation of code."

"BDD focuses on writing scenarios that describe the behavior of the software, often using a language that stakeholders can understand." Thus, Option B is accurate - TDD targets code implementation, BDD targets behavioral expectations.

* Option A is incorrect - TDD is at unit level, while BDD is at the acceptance level.

* Option C is false -BDD is more readable and accessible for non-technical stakeholders.

* Option D confuses BDD with user story formats; BDD uses Given-When-Then, not the "As a... I want..." template.

Learning Objective (K2) - Differentiate TDD and BDD practices

NEW QUESTION # 44

Which of the following would provide the MOST independence for testers working with agile teams?

- A. Testers from an independent test team who do not get involved with the Agile team, but are assigned to do System Testing once all sprints are completed.
- B. Testers are fully embedded in each Agile team to perform many of the testing tasks.
- C. Testers from an independent test team are assigned to the Agile team at the beginning of the project, returning for re-assignment to a new agile team.
- D. Testers from an independent test team are assigned on-demand for the final days of each sprint.

Answer: A

NEW QUESTION # 45

You are working in a team preparing a bank loan application. Your task is the preparation of acceptance tests for the following user story:

"If a customer needs a loan for less than 50,000 Euros and they have made repayments regularly (without any delay) and the customer's monthly income is more than 3000 Euros for the last year, THEN the bank will accept the loan request; in other cases, the bank will not accept the request. A customer assistant is responsible for preparing data for approval but the approval is done by the bank manager." Which of the following test cases can be treated as acceptance test criteria for the above user story?

- 1) As a customer assistant I can log in to the system and check the history of the customer account for the last year.
- 2) As a customer assistant I can log in to the system and check the history of the customer debts and repayments.
- 3) As a customer assistant I can log in to the system and change my password.
- 4) As a bank manager I can log in to the system and receive the information of all requests waiting for approval.
- 5) As a bank manager I can log in to the system and decide whether to approve a loan for a customer.
- 6) As a bank manager I can log in to the system within 10 seconds.

- A. Acceptance test criteria are 1, 3, 4 and 5
- B. Acceptance test criteria are 1, 2, 3 and 6
- C. Acceptance test criteria are 2, 4, 5 and 6
- D. Acceptance test criteria are 1, 2, 4 and 5

Answer: D

NEW QUESTION # 46

Which of the following is a risk that continuous integration introduces?

- A. Teams sometimes over-rely on unit tests and exclude some important system and acceptance tests.
- B. Developer's workload is increased, which can result in a reduction of output.
- C. Teams no longer have the ability to run manual tests, as all tests must be automated.
- D. Testers sometimes have too many builds to test, which reduces the quality of testing.

Answer: D

Explanation:

Explanation

Continuous integration is a practice of integrating code changes frequently and automatically into a shared repository, and running automated tests to verify the integration. Continuous integration can introduce some risks to the testing process, such as:

Testers sometimes have too many builds to test, which reduces the quality of testing. This can happen when the code changes are too frequent or too large, and the testers do not have enough time or resources to test each build thoroughly. This can lead to missed defects, incomplete test coverage, and reduced confidence in the product quality.

Testers sometimes have to deal with unstable or broken builds, which affects the testability of the product. This can happen when the

code changes introduce errors or conflicts that cause the build to fail or malfunction. This can waste the testers' time and effort, and delay the feedback cycle.

Testers sometimes have to cope with changing requirements and priorities, which affects the test planning and execution. This can happen when the stakeholders or customers provide new or modified requirements or feedback during the development cycle. This can require the testers to adapt their test strategy, test cases, and test data accordingly, and to balance the testing of new features and regression testing of existing features.
