NEW QUESTION # 326

A customer requires wireless traffic from the branch to be routed through the firewall at corporate headquarters. A RADIUS server is in each branch location. Which Cisco FlexConnect configuration must be used?

- A. local authentication and central switching
- B. central authentication and local switching
- **C. central authentication and central switching**
- D. local authentication and local switching

Answer: C

Explanation:

To route wireless traffic from the branch through the firewall at corporate headquarters, the correct Cisco FlexConnect configuration is central authentication and central switching. This setup ensures that both user authentication and data traffic are handled centrally at the corporate headquarters, allowing the firewall to inspect and route the traffic accordingly. Local RADIUS servers in each branch can still be used for redundancy or other purposes, but the central control of traffic is maintained.
