Cisco Developing Applications using Cisco Core Platforms and APIs (DEVCOR) Sample Questions (Q351-Q356):

NEW QUESTION # 351
Drag and drop the characteristics from the left onto the correct data processing techniques on the right, in the context of GDPR.

Answer:

Explanation:

NEW QUESTION # 352

Refer to the exhibit above and click on the resource tabs in the top left corner to view an IETF TANG MODEL and a Python file that changes the configuration via RESTCONF. Drag and drop the code snippets from the left onto the item numbers on the right that match the missing sections in the exhibit to complete the JSON file that changes configuration of interface GigabitEthernet1 to have an IPv4 configuration of
10.10.0.1/24. Not all options are used.

Answer:

Explanation:

NEW QUESTION # 353
DRAG DROP

Refer to the exhibit. The self-service Webex Teams bot is failing when many users attempt to interact with it at the same time. Drag and drop the code snippets from the left onto the correct item numbers on the right that match the missing sections in the exhibit to complete this code to handle this high-load situation.
Select and Place:

Answer:

Explanation:
Section: Cisco Platforms

NEW QUESTION # 354
Drag and drop the code from the bottom onto the box where the code is missing to retrieve and display wireless network hearth information. The wireless network devices are being managed by Cisco DNA Center and are compatible with REST API Not all options are used.

Answer:

Explanation:

NEW QUESTION # 355
A developer is containerizing an application using Docker. A local Docker alpine image has been created, and it has the image ID "abc1d2e3f4g56789' with the tag 'dev'. The developer must make a running container based on the tagged image, with the container port 80 bound to port
8080 on the host. Which command must be used?

- A. docker exec -p 8080:80 alpine:dev
- B. docker build -p 8080:80 alpine:dev
- C. docker run -p 8080:80 alpine:dev
- D. docker start -p 8080:80 alpine:dev

Answer: C

Explanation:
docker run both creates and starts a new container from an image. The -p 8080:80 option maps port 8080 on the host to port 80 inside the container. alpine:dev tells Docker to use the local Alpine image tagged "dev" (with ID abc1d2e3f4g56789).
docker start only starts an existing (stopped) container; it doesn't create a new one or accept -p.
docker build builds an image from a Dockerfile, it doesn't run containers.
docker exec runs a command in a running container; it's not used to create or port-bind a container.
