## AWS Certified Solutions Architect – Associate SAA-C03 Exam Questions and Answers

### Exam Question 1

A company is migrating from an on-premises infrastructure to the AWS Cloud. One of the company's applications stores files on a Windows file server farm that uses Distributed File System Replication (DFS-R) to keep data in sync. A solutions architect needs to replace the file server farm.

Which service should the solutions architect use?

- A. Amazon EFS
- B. Amazon FSx
- C. Amazon S3
- D. AWS Storage Gateway

### Correct Answer

B. Amazon FSx

### Exam Question 2

A company has a legacy application that processes data in two parts. The second part of the process takes longer than the first, so the company has decided to rewrite the application as two microservices running on Amazon ECS that can scale independently.

How should a solutions architect integrate the microservices?

- A. Implement code in microservice 1 to send data to an Amazon S3 bucket. Use S3 event notifications to invoke microservice 2.
- B. Implement code in microservice 1 to publish data to an Amazon SNS topic. Implement code in microservice 2 to subscribe to this topic.
- C. Implement code in microservice 1 to send data to Amazon Kinesis Data Firehose. Implement code in microservice 2 to read from Kinesis Data Firehose.
- D. Implement code in microservice 1 to send data to an Amazon SQS queue. Implement code in microservice 2 to process messages from the queue.

### Correct Answer

C. Implement code in microservice 1 to send data to Amazon Kinesis Data Firehose. Implement code in microservice 2 to read from Kinesis Data Firehose.

### Exam Question 3

A company captures clickstream data from multiple websites and analyzes it using batch processing. The data is loaded nightly into Amazon Redshift and is consumed by business

## Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q646-Q651):

### NEW QUESTION # 646

A customer wants to track access to their Amazon Simple Storage Service (S3) buckets and also use this information for their internal security and access audits. Which of the following will meet the Customer requirement?

- A. Enable server access logging for all required Amazon S3 buckets.
- B. Enable Amazon S3 event notifications for Put and Post.
- C. Enable AWS CloudTrail to audit all Amazon S3 bucket access.
- D. Enable the Requester Pays option to track access via AWS Billing

**Answer: A**

### NEW QUESTION # 647

A company runs an application on AWS. The application receives inconsistent amounts of usage. The application uses AWS Direct Connect to connect to an on-premises MySQL-compatible database. The on-premises database consistently uses a minimum of 2 GiB of memory.

The company wants to migrate the on-premises database to a managed AWS service. The company wants to use auto scaling capabilities to manage unexpected workload increases.

Which solution will meet these requirements with the LEAST administrative overhead?

- A. Provision an Amazon RDS for MySQL database with 2 GiB of memory.
- B. Provision an Amazon Aurora database with a minimum capacity of 1 Aurora capacity unit (ACU).
- C. Provision an Amazon Aurora Serverless v2 database with a minimum capacity of 1 Aurora capacity unit (ACU).
- D. Provision an Amazon DynamoDB database with default read and write capacity settings.

**Answer: C**

Explanation:

it allows the company to migrate the on-premises database to a managed AWS service that supports auto scaling capabilities and has the least administrative overhead. Amazon Aurora Serverless v2 is a configuration of Amazon Aurora that automatically scales compute capacity based on workload demand. It can scale from hundreds to hundreds of thousands of transactions in a fraction of a second. Amazon Aurora Serverless v2 also supports MySQL-compatible databases and AWS Direct Connect connectivity.

### NEW QUESTION # 648

A company is migrating to the AWS Cloud. A file server is the first workload to migrate. Users must be able to access the file share using the Server Message Block (SMB) protocol. Which AWS managed service meets these requirements?

- A. Amazon S3
- B. Amazon EBS
- C. Amazon EC2
- D. Amazon FSx

**Answer: D**

### NEW QUESTION # 649

A company is building a stock trading application in the AWS Cloud. The company requires a highly available solution that provides

low-latency access to block storage across multiple Availability Zones.

- A. Create an Amazon EC2 instance in each Availability Zone. Attach a Provisioned IOPS SSD (io2) Amazon Elastic Block Store (Amazon EBS) volume to each EC2 instance. Create a Python script to sync data between volumes.
- **B. Use an Amazon FSx for NetApp ONTAP Multi-AZ file system to access data by using the iSCSI protocol.**
- C. Use an Amazon S3 bucket and an S3 File Gateway as shared storage for the application.
- D. Create an Amazon EC2 instance in each Availability Zone. Attach a General Purpose SSD (gp3) Amazon Elastic Block Store (Amazon EBS) volume to each EC2 instance. Create a Bash script to sync data between volumes.

**Answer: B**

Explanation:

Amazon FSx for NetApp ONTAP supports Multi-AZ, providing automatic failover between Availability Zones for high availability. It exposes ONTAP LUNs over the iSCSI protocol, delivering shared block storage semantics with low latency and consistent performance to EC2 clients across AZs. This meets the requirement for "highly available" and "low-latency" block access across multiple AZs. S3/S3 File Gateway (A) is object

/file, not block storage. EBS (B, D) provides block storage to a single instance in a single AZ; EBS volumes cannot be shared across instances/AZs, and host-side sync scripts add latency, complexity, and do not provide true HA. FSx for ONTAP natively provides synchronous HA pair replication, fast failover, and supports iSCSI multipathing for resilient, performant access suited to latency-sensitive trading workloads.

#### NEW QUESTION # 650

When designing an Amazon SQS message-processing solution, messages in the queue must be processed before the maximum retention time has elapsed.

Which actions will meet this requirement? (Choose two.)

- A. Use Amazon EBS-optimized Amazon EC2 instances to process the messages
- **B. Use Amazon EC2 instances in an Auto Scaling group with scaling triggered based on the queue length**
- C. Convert the SQS queue to a first-in first-out (FIFO) queue
- **D. Increase the SQS queue attribute for the message retention period**
- E. Use AWS STS to process the messages

**Answer: B,D**
