

Training GICSP Pdf - Latest GICSP Exam Discount

No doubt the Global Industrial Cyber Security Professional (GICSP) (GICSP) certification is one of the most challenging certification exams in the market. This Global Industrial Cyber Security Professional (GICSP) (GICSP) certification exam gives always a tough time to Global Industrial Cyber Security Professional (GICSP) (GICSP) exam candidates. The VCETorrent understands this hurdle and offers recommended and real GIAC GICSP exam practice questions in three different formats.

Before the clients decide to buy our GICSP test guide they can firstly be familiar with our products. The clients can understand the detailed information about our products by visiting the pages of our products on our company's website. Firstly you could know the price and the version of our GICSP study question, the quantity of the questions and the answers. Secondly you could look at the free demos of our GICSP learning prep to see if the questions and the answers are valuable. And our pass rate of GICSP exam questions is more than 98%.

Hot Training GICSP Pdf | High-quality Latest GICSP Exam Discount: Global Industrial Cyber Security Professional (GICSP) 100% Pass

Preparing for the GICSP exam can be a daunting task, but with real GICSP exam questions, it can be a lot easier. The importance of actual Global Industrial Cyber Security Professional (GICSP) (GICSP) questions cannot be overemphasized. GICSP Real Questions are crucial for passing the GICSP exam. When candidates have access to the updated GIAC GICSP practice test questions, they are better prepared to succeed.

GIAC Global Industrial Cyber Security Professional (GICSP) Sample Questions (Q33-Q38):

NEW QUESTION # 33

A plant is being retrofitted with new cyber security devices in Purdue Level 3. What should the network security architect suggest for the installation?

- A. Place the cyber security devices on their own subnet
- B. Add a firewall to segregate the cyber security devices
- C. Move the cyber security devices to a DMZ

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

In Purdue Level 3, which typically houses operations management systems and network devices, best practices for retrofitting security devices include placing those devices on their own subnet (B). This segmentation:

Limits broadcast domains and reduces unnecessary traffic

Enables easier management of security policies specific to cybersecurity devices Provides isolation that helps protect security devices from general network traffic and potential attacks Adding a firewall (A) is useful but does not replace subnet segregation. Moving

devices to a DMZ (C) is typically reserved for systems that bridge between enterprise and ICS networks (often at Purdue Level 3 to Level 4 boundaries), not internal device placement within Level 3.

This approach is emphasized in GICSP's ICS Security Architecture & Network Segmentation domain as a fundamental network design principle.

GICSP Official Study Guide, Domain: ICS Security Architecture & Design

NIST SP 800-82 Rev 2, Section 5.5 (Network Segmentation and Security Devices) GICSP Training on Network Security Architecture

NEW QUESTION # 34

What is a benefit of log aggregation?

- A. Assists in analysis of log data from multiple sources
- B. Simplifies initial setup of logging in the environment
- C. Eliminates the need for baselining normal log activity
- D. Reduces system load on logging devices

Answer: A

Explanation:

Log aggregation involves collecting log data from multiple devices and systems into a centralized repository.

This provides a holistic view of the environment and enables security teams to correlate events across disparate sources. The key benefit of log aggregation is that it:

Assists in analysis of log data from multiple sources (D) by providing a unified platform for searching, filtering, and correlating events, enabling quicker detection of security incidents and comprehensive forensic investigations.

While log aggregation can help improve management, it does not simplify initial setup (A), nor does it inherently reduce system load (B) because devices still generate logs locally. It also does not eliminate the need for baselining normal activity (C), which remains essential for detecting anomalies.

GICSP stresses centralized logging as a critical component of effective ICS security monitoring and incident response.

GICSP Official Study Guide, Domain: ICS Security Operations & Incident Response NIST SP 800-92 (Guide to Computer Security Log Management) GICSP Training Materials on Security Monitoring and Incident Analysis

NEW QUESTION # 35

Which of the following technologies uses Secure Simple Pairing (SSP) to pair devices?

- A. WirelessHART
- B. ISA100.11a
- C. Bluetooth
- D. Zigbee

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Secure Simple Pairing (SSP) is a security feature used in Bluetooth technology (B) to provide improved authentication and encryption during device pairing.

Zigbee (A), WirelessHART (C), and ISA100.11a (D) use different security mechanisms adapted to industrial wireless environments and do not use SSP.

GICSP training covers Bluetooth SSP as part of wireless security protocols.

NEW QUESTION # 36

Which of the following devices is most likely to be in the same level as an HMI workstation that interfaces with a PLC?

- A. Programmable logic controller
- **B. Remote terminal unit**
- C. Variable speed drive
- D. Data historian

Answer: B

Explanation:

In the Purdue model, HMIs typically reside at Level 2 (Supervisory Control), providing interfaces for operators to monitor and control devices. Remote Terminal Units (RTUs) (D) also commonly reside at this level, interfacing between controllers and supervisory systems.

Variable speed drives (A) and PLCs (B) are usually located at Level 1 (Control Devices LAN).

Data historians (C) typically reside at Level 3 or higher in the Operations Support DMZ or enterprise network.

GICSP materials emphasize proper classification of devices by Purdue levels for effective network segmentation and security.

NEW QUESTION # 37

What is a recommended practice for configuring enforcement boundary devices in an ICS control network?

- **A. Enable full packet collection for all allowed and denied traffic rules on next-generation firewalls**
- B. Create one rule for each authorized conversation in a stateless access control list
- C. Use an egress policy that allows everything out except for that which is explicitly denied
- D. Create a rule which drops inbound packets containing a source address from within the protected network

Answer: A

Explanation:

Enforcement boundary devices like firewalls play a critical role in ICS network security. A best practice is to:

Enable full packet collection for all allowed and denied traffic (B) on next-generation firewalls. This facilitates deep inspection, detailed logging, and auditing, which are vital for detecting anomalous or malicious activity.

Other options are less effective or counterproductive:

(A) Dropping inbound packets with source addresses from the protected network is generally illogical and may disrupt normal traffic.

(C) Stateless access control is less secure and less manageable than stateful inspection.

(D) Default allow egress policies increase risk by permitting unnecessary outbound traffic.

GICSP stresses detailed logging and stateful inspection as core security controls for enforcement points.
