2026 Die neuesten Pass4Test 1z0-076 PDF- Versionen Prüfungsfragen und 1z0-076 Fragen und Antworten sind kostenlos verfügbar: https://drive.google.com/open?id=1YCcXpbc6EN_7bTvH-2zYjR6kUq_N7RJ1

Pass4Test ist eine Website, die Ihnen immer die genauesten und neuesten Materialien zur 1z0-076 Zertifizierungsprüfung bieten. Damit Sie sicher für uns entscheiden, können Sie kostenlos Teil der Prüfungsfragen und Antworten im Pass4Test Website kostenlos als Probe herunterladen. Pass4Test garantieren Ihnen, dass Sie 100% die Oracle 1z0-076 Zertifizierungsprüfung bestehen können.

Oracle 1z0-076 Prüfungsplan:

Thema	Einzelheiten
Thema 1	Performing Role Transitions: Here, the concept of database roles is explained, along with the steps for performing switchovers, failovers, and maintaining physical standby sessions during role transitions.
Thema 2	Creating a Data Guard Broker Configuration: This section delves into the practical aspects of creating and managing a Data Guard broker configuration, including command-line and Enterprise Manager approaches.
Thema 3	Enhanced Client Connectivity in a Data Guard Environment: This topic focuses on enhancing client connectivity in a Data Guard setup and implementing failover procedures for seamless client redirection. It also covers application continuity to ensure uninterrupted operations during role transitions.

Thema 4	Using Oracle Active Data Guard: Supported Workloads in Read-Only Standby Databases: Here, the usage of physical standby databases for real-time queries is discussed.
Thema 5	Monitoring a Data Guard Broker Configuration: The topic covers the use of Enterprise Manager and DGMGRL to monitor Data Guard configurations and explains the various data protection modes available.
Thema 6	Backup and Recovery Considerations in an Oracle Data Guard Configuration: In this topic, Backup and recovery procedures in a Data Guard configuration are discussed, including RMAN backups, offloading to physical standby, and network-based recovery.

1z0-076 Dumps, 1z0-076 Prüfungsübungen

Wie andere weltberühmte Zertifizierungen wird die 1z0-076 Zertifizierungsprüfung auch international akzeptiert. Die 1z0-076 Zertifizierungsprüfungen haben auch breite IT-Zertifizierungen. Die Leute in der ganzen Welt wählen gerne die 1z0-076 Zertifizierungsprüfung, um Erfolg im Berufsleben zu erlangen. In Pass4Test können Sie die Ihnen geeigneten Produkte zum Lernen wählen.

Oracle Database 19c: Data Guard Administration 1z0-076 Prüfungsfragen mit Lösungen (Q53-Q58):

53. Frage

You must propose an Oracle Data Guard configuration for a database supporting an OLTP workload that meets these permanent requirements:

Data loss is not permitted.

Read-only applications should not connect to the primary database instance.

Additionally, there are these requirements, only one of which is ever done at any one time:

It should be possible to apply and test designated patches with a minimum amount of downtime.

Upgrading to a new database release should be performed with the least possible amount of downtime.

New application software releases should be tested against an exact up-to-date replica of the production database.

You propose a primary database with one physical standby database configured in Maximum Protection mode.

Which requirements do you meet?

- A. Only requirement 1
- B. 2, 3, 4, and 5
- C. Only requirement 5
- D. 1 and 2
- E. 1, 2, 3, 4, and 5

Antwort: A

54. Frage

You notice that the SQL apply lag on your logical standby database has increased but the redo transport lag has not.

Which four could be reasons for the increase in SQL apply lag?

- A. Many SQL apply operations do full table scans
- B. An undersized shared pool
- C. An undersized undo tablespace on the logical standby
- D. An increased number of bulk inserts on the primary
- E. An increased number of bulk updates on the primary
- F. The standby redo log files are undersized on the primary database

Antwort: A,B,C,E

Begründung:

The SQL apply lag on a logical standby database can be caused by several factors:

- * A: An undersized undo tablespace can lead to delays in SQL apply operations as it may not be able to handle the volume of undo records generated by the SQL apply process.
- * B: SQL apply operations that do full table scans can consume significant system resources, potentially leading to higher apply lag.
- * C: An increased number of bulk updates on the primary database may generate a large volume of redo data, which can cause apply lag if the logical standby cannot apply the changes quickly enough.
- * F: An undersized shared pool may affect the parsing and execution of SQL statements by SQL apply, which can contribute to the apply lag.

Option D is less likely to be a direct cause of SQL apply lag compared to bulk updates, as inserts generate new data rather than modifying existing data, which SQL apply can typically handle more efficiently.

Option E is incorrect because the size of the standby redo log files on the primary database impacts redo transport lag, not SQL apply lag.

References: Oracle Database High Availability Overview and Oracle Data Guard Concepts and Administration guide provide insights into the factors affecting SQL apply performance on logical standby databases.

55. Frage

You are using Data Guard in conjunction with Global Database Services.

You have a Data Guard Broker configuration called Sales and a GDS pool called Prod.

Which three are true concerning the management of the broker configuration when using GDS?

- A. Adding a database to the Sales configuration with DGMGRL automatically adds the database to the Prod Pool.
- B. DGMGRL may be used to add a single database to the Sales configuration even if Sales is a member of the Prod pool.
- C. DGMGRL may be used to add the Sales configuration to the Prod pool in gds.
- D. Performing a role change with DGMGRL automatically notifies GDS which in turn activates the appropriate services.
- E. Adding a database to the Sales configuration with DGMGRL requires that the Sales configuration be disabled first. It must then be enabled after the new database is added to the configuration.

Antwort: B,C,D

Begründung:

In the context of Oracle Data Guard and Global Database Services (GDS):

* DGMGRL may be used to add the Sales configuration to the Prod pool in gds (A): Data Guard Broker's command-line interface DGMGRL can be utilized to manage configurations with GDS, allowing the addition of Data Guard Broker configurations to GDS pools.

* Performing a role change with DGMGRL automatically notifies GDS which in turn activates the appropriate services (B): When a role change is executed using DGMGRL, GDS is automatically notified, and it then activates the services that are appropriate for the new database roles.

* DGMGRL may be used to add a single database to the Sales configuration even if Sales is a member of the Prod pool (C): DGMGRL provides the capability to manage individual databases within a broker configuration, including adding databases to a configuration that is already part of a GDS pool. * Oracle Data Guard Broker documentation

* Oracle Global Data Services documentation

56. Frage

Which TWO are benefits of using Transaction Guard in a Data Guard environment?

- A. It provides application continuity by rolling back uncommitted transactions interrupted by a failover or switchover.
- B. It protects against user errors being replicated to standby databases.
- C. It provides application continuity by replaying transactions interrupted by a failover or a switchover.
- D. It protects against recoverable errors during a planned or an unplanned outage of a primary database.
- E. It protects against logical corruptions being replicated to standby databases.

Antwort: A,D

Begründung:

Transaction Guard provides benefits in terms of transaction consistency and recovery in a Data Guard environment:

It provides application continuity by rolling back uncommitted transactions interrupted by a failover or switchover (B): Transaction Guard ensures that any uncommitted transactions at the time of an outage are rolled back consistently, thus preserving the integrity of the application's data and state.

It protects against recoverable errors during a planned or an unplanned outage of a primary database (D); Transaction Guard offers protection against errors that can occur during outages, allowing applications to resume operations more quickly and reliably after recovery.

57. Frage

Which three actions are performed by the START PLAN procedure of the DBMS ROLLING package?

- A. creating a guaranteed restore point on the standby databases
- B. building a LogMiner dictionary on the primary database instance
- C. creating a guaranteed restore point on the primary database
- D. starting media recovery on all the Leading Group Standby databases
- E. converting the designated physical standby database into a logical standby database
- F. switching the primary database to the logical standby role

Antwort: A,B,C

Begründung:

The DBMS_ROLLING package facilitates a rolling upgrade process across a Data Guard configuration. The START PLAN procedure in particular handles several critical actions, including:

* Creating a guaranteed restore point on the standby databases (B): This ensures that the standby databases can be reverted to their state before the rolling upgrade process in case of any issues.

* Building a LogMiner dictionary on the primary database instance (C): This is necessary for logical standby databases to interpret redo data during the SQL Apply process.

* Creating a guaranteed restore point on the primary database (D): Similar to the standby databases, this ensures that the primary database can be reverted to a known good state if necessary. References:
