NEW QUESTION # 105

How does an on-premises infrastructure compare to a cloud infrastructure?

- **A. On-premises offers lower latency for physically adjacent systems than cloud.**
- B. On-premises offers faster deployment than cloud
- C. On-premises can increase compute power faster than cloud
- D. On-premises requires less power and cooling resources than cloud

Answer: A

Explanation:

On-premises infrastructures are physically closer to the end-user or the systems that are using them, which typically results in lower latency due to the reduced distance data must travel compared to cloud infrastructures. This proximity allows for quicker data retrieval and processing, making it ideal for applications that require real-time or near-real-time access to data.

NEW QUESTION # 106

        'Accept': 'application/yang-data+json',
        'Content-Type': 'application/yang-data+json'
    },
    data = json.dumps({
        'Cisco-IOS-XE-native:GigabitEthernet': {

- url = 'https://192.168.159.10/restconf/data/Cisco-IOS-XE-native:native/interface/GigabitEthernet2',
- data = json.dumps({
 'Cisco-IOS-XE-native:GigabitEthernet2': {
- response = requests.patch(
 data = json.dumps({
 'Cisco-IOS-XE-native:GigabitEthernet': {
 'ip': {
 'address': {
 interface': {

- A. Option A
- B. Option D
- C. Option B
- D. Option C

NEW QUESTION # 107

What is the purpose of the LISP routing and addressing architecture?

- A. It creates head-end replication used to deliver broadcast and multicast frames to the entire network.
- **B. It creates two entries for each network node, one for its identity and another for its location on the network.**
- C. It allows multiple Instances of a routing table to co-exist within the same router.
- D. It allows LISP to be applied as a network visualization overlay through encapsulation.

Answer: B

Explanation:

Locator ID Separation Protocol (LISP) solves this issue by separating the location and identity of a device through the Routing locator (RLOC) and Endpoint identifier (EID):

+ Endpoint identifiers (EIDs) ?assigned to end hosts.

+ Routing locators (RLOCs) ?assigned to devices (primarily routers) that make up the global routing system
