Palo Alto Networks Cybersecurity Practitioner Sample Questions (Q180-Q185):

NEW QUESTION # 180

Which model would a customer choose if they want full control over the operating system(s) running on their cloud computing platform?

- A. PaaS
- **B. IaaS**
- C. DaaS
- D. SaaS

Answer: B

Explanation:

IaaS (Infrastructure as a Service) is a cloud computing model that delivers on-demand infrastructure resources to organizations via the cloud, such as compute, storage, networking, and virtualization¹. Customers do not have to manage, maintain, or update their own data center infrastructure, but are responsible for the operating system, middleware, virtual machines, and any apps or data¹. Therefore, IaaS gives customers full control over the operating system(s) running on their cloud computing platform, as well as the flexibility to customize and configure their infrastructure according to their needs². NEW QUESTION # 181

If an endpoint does not know how to reach its destination, what path will it take to get there?

- A. The endpoint will forward data to another endpoint to send instead.
- **B. The endpoint will send data to the specified default gateway.**
- C. The endpoint will broadcast to all connected network devices.
- D. The endpoint will not send the traffic until a path is clarified.

Answer: B

Explanation:

If an endpoint does not know how to reach its destination, it will send data to the specified default gateway. A default gateway is a device that routes traffic from a local network to other networks or the internet. The endpoint will use the default gateway's IP address as the next hop for packets that are destined for unknown or remote networks. The default gateway will then forward the packets to the appropriate destination or another gateway, based on its routing table. NEW QUESTION # 182

Match the DNS record type to its function within DNS.

Answer Area

CNAME	MX
SOA	NS

	Maps domain of subdomain to another hostname
	Specifies an authoritative name server for a given host
	Specifies the hostname or hostnames of email servers for a domain
	Specifies authoritative information about DNS Zone such as Primary name server

Answer:

Explanation:

Answer Area

CNAME	MX
SOA	NS

CNAME	Maps domain of subdomain to another hostname
NS	Specifies an authoritative name server for a given host
MX	Specifies the hostname or hostnames of email servers for a domain
SOA	Specifies authoritative information about DNS Zone such as Primary name server

NEW QUESTION # 183

Which TCP/IP sub-protocol operates at the Layer7 of the OSI model?

- A. NFS
- B. UDP
- C. SNMP
- D. MAC

Answer: C

Explanation:

* Application (Layer 7 or L7): This layer identifies and establishes availability of communication partners, determines resource availability, and synchronizes communication.

* Presentation (Layer 6 or L6): This layer provides coding and conversion functions (such as data representation, character conversion, data compression, and data encryption) to ensure that data sent from the Application layer of one system is compatible with the Application layer of the receiving system.

* Session (Layer 5 or L5): This layer manages communication sessions (service requests and service responses) between networked systems, including connection establishment, data transfer, and connection release.

* Transport (Layer 4 or L4): This layer provides transparent, reliable data transport and end-to-end transmission control.

NEW QUESTION # 184

Which key component is used to configure a static route?

- A. enable setting
- **B. next hop IP address**
- C. routing protocol
- D. router ID

Answer: B

Explanation:

A static route is a manually configured route that specifies the destination network and the next hop IP address or interface to reach it. A static route does not depend on any routing protocol and remains in the routing table until it is removed or overridden. Static routes are useful for defining default routes, reaching stub networks, or providing backup routes in case of link failures. To configure a static route in a virtual router on a Palo Alto Networks firewall, you need to specify the name, destination, interface, and next hop IP address or virtual router of the route.
