Fortinet NSE 6 - OT Security 7.6 Architect Sample Questions (Q21-Q26):

NEW QUESTION # 21

Refer to the exhibit, which shows a nonprotected OT environment. An administrator needs to implement appropriate protection on the OT network.

Which three steps should an administrator take to protect the OT network? (Choose three.)

- A. Deploy a FortiGate device within each ICS network.
- B. Use segmentation.
- C. Configure firewall policies with web filtering to protect the different ICS networks.
- D. Configure firewall policies with industrial protocol sensors.
- E. Deploy an edge FortiGate between the internet and the OT network as a one-arm sniffer.

Answer: A,B,D

Explanation:

Use segmentation: Network segmentation is critical in an OT environment to isolate different ICS (Industrial Control System) networks and protect sensitive systems. This limits the spread of threats and provides controlled access between segments.

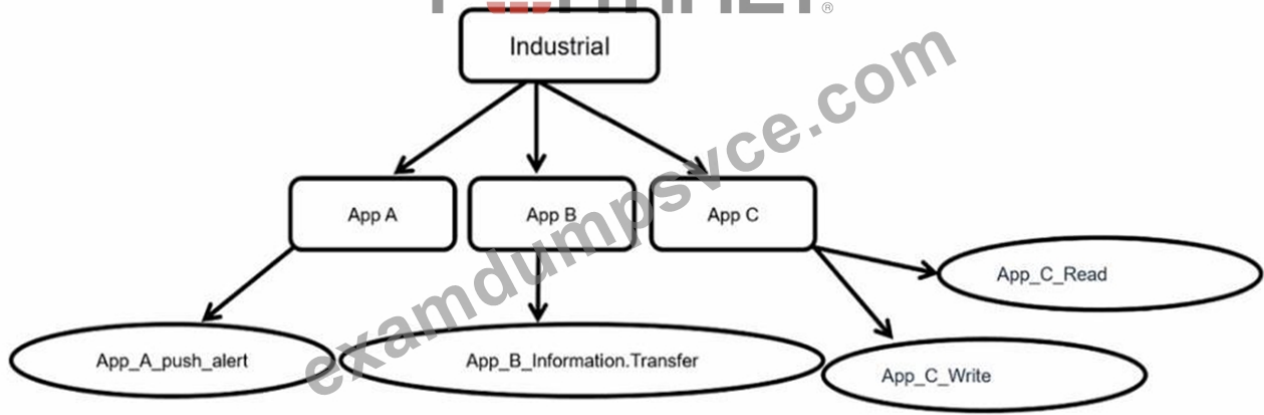

Deploy a FortiGate device within each ICS network: Deploying FortiGate devices in each ICS network ensures that localized security measures are in place to detect and prevent unauthorized access or threats.

Configure firewall policies with industrial protocol sensors: Configuring policies with industrial protocol sensors helps monitor and protect OT-specific traffic (e.g., Modbus, DNP3).

This enables the FortiGate to detect and respond to malicious activities targeting OT protocols.

NEW QUESTION # 22

Refer to the exhibit. Which statement is true about application control inspection?

- A. You can control security actions only on the parent-level application signature
- **B. The parent signature takes precedence over the child application signature.**
- C. Security actions cannot be applied on the lowest level of the hierarchy.
- D. The industrial application control inspection process is unique among application categories.

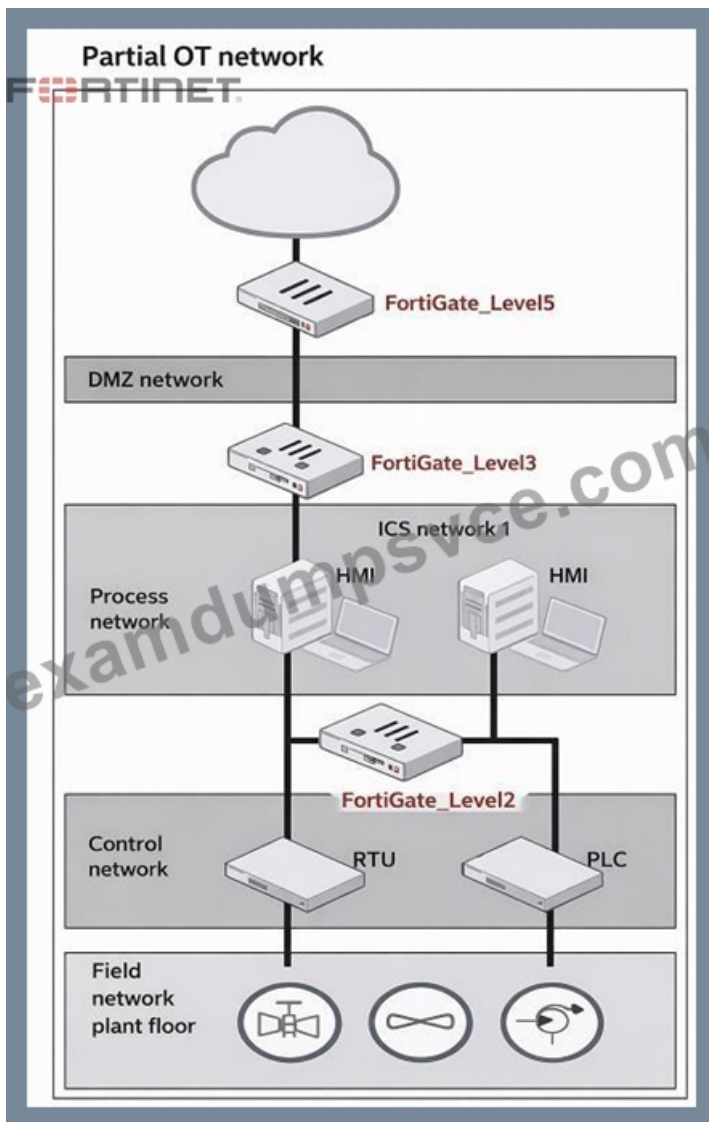

Answer: B

Explanation:

Application control inspection in Fortinet firewalls utilizes a hierarchical structure where applications are categorized and classified. A parent signature encompasses a group of related child applications. If a security action is defined on the parent signature, it will apply to all child applications within that group. Therefore, the parent signature takes precedence over the child application signature, meaning if a child application is allowed access based on its own signature but the parent signature has a blocking rule, the child application will still be blocked.

NEW QUESTION # 23

Refer to the exhibit. A partial OT network is shown.

In this OT network, you must add additional security measures to detect OT protocols and, therefore, increase the traffic visibility. Which security sensor must you implement to detect the OT protocols in this network? (Choose one answer)

- A. IPS sensor on FortiGate Level5
- B. Device detection on all the FortiGate interfaces
- C. Inline IDS on FortiGate_Level3
- D. Application sensor set to monitor on all the FortiGate devices

Answer: D

NEW QUESTION # 24

What are two advantages provided by industrial Ethernet? (Choose two answers)

- A. Real-time control
- B. Encryption
- C. Determinism
- D. Remote access

Answer: A,C

Explanation:

The correct answers are B. Real-time control and D. Determinism. The study guide defines industrial Ethernet as the "use of Ethernet and TCP/IP as transport mechanisms for industrial protocols" and states that it provides "real-time control," "low latency," and "determinism (meaning reliable and predictable data delivery)" in harsh environments. It further explains that industrial Ethernet "provides deterministic communication between machine controllers, actuators, sensors, and other units." These statements directly

confirm that the two key advantages are real-time control and determinism.

The other options are not supported by the study guide as core advantages of industrial Ethernet. Encryption is not listed as one of the benefits in this section, and remote access is discussed elsewhere in the OT architecture but not as a defining advantage of industrial Ethernet itself. The guide is explicit that the main benefits here are predictable delivery and real-time communication, which are essential in industrial control environments where timing and reliability matter.

NEW QUESTION # 25

An OT administrator configured and ran a default application risk and control report in FortiAnalyzer to learn more about the key application crossing the network. However, the report output is empty despite the fact that some related real-time and historical logs are visible in the FortiAnalyzer.

What are two possible reasons why the report output was empty? (Choose two.)

- A. The administrator selected the wrong hcache table for the report.
- **B. The administrator selected the wrong devices in the Devices section.**
- **C. The administrator selected the wrong time period for the report.**
- D. The administrator selected the wrong logs to be indexed in FortiAnalyzer.

Answer: B,C
