Valid CV0-004 Exam Labs, CV0-004 VCE Dumps

What does it mean to win a competition? Users of our CV0-004 actual exam can give you good answers. They have improved their strength and proved their strength. Now they have more opportunities and they have the right to choose. Of course, the effective learning methods they learned during the use of our CV0-004 Preparation materials also greatly enhanced their work. All of them had praised that our CV0-004 exam questions are the best choice they had made to buy. So what are you waiting for? Just rush to buy our CV0-004 practice guide!

CompTIA Cloud+ (CV0-004) Certification Exam Sample Questions (Q224-Q229):

NEW QUESTION # 224

Which of the following application migration strategies will best suit a customer who wants to move a simple web application from an on-premises server to the cloud?

- A. Retain
- B. Rearchitect
- C. Rehost
- D. Refactor

Answer: C

Explanation:

Rehosting, often referred to as a "lift and shift" strategy, is the best suit for a customer who wants to move a simple web application from an on-premises server to the cloud. It involves moving the application to the cloud without making significant changes, which

can be a quick and cost-effective migration approach for straightforward applications.

The various cloud migration strategies, including rehosting, are part of the knowledge base for cloud migration in the CompTIA Cloud+ certification.

NEW QUESTION # 225

A cloud solutions architect wants to deploy a three-tier web application that requires the minimum amount of operational overhead. Which of the following is the best template given these requirements?

- A.
- B.
- C.
- D.

Answer: B

Explanation:

Chosen template leverages serverless functions for the backend, managed relational databases with clustering, and object storage with static web content enabled. This setup minimizes operational overhead by avoiding direct management of virtual machines for application and database tiers, using serverless and managed services instead. It aligns best with the requirement for minimal operational overhead in deploying a three-tier web application.

NEW QUESTION # 226

An administrator is creating a cron job that shuts down the virtual machines at night to save on costs. Which of the following is the best way to achieve this task?

- A.
- B.
- C.
- D.

Answer: D

Explanation:

Option C is the correct script for shutting down virtual machines that are currently running. It iterates through a list of VMs, checks if the status of each VM is 'running', and if so, proceeds to shut down the VM. The script then prints a message stating that the VM has been stopped. This approach ensures that only VMs that are actively running are targeted for shutdown, optimizing resource utilization and cost savings.

NEW QUESTION # 227

A user's assigned cloud credentials are locked, and the user is unable to access the project's application. The cloud administrator reviews the logs and notices several attempts to log in with the user's account were made to a different application after working hours. Which of the following is the best approach for the administrator to troubleshoot this issue?

- A. Track the source of the log-in attempts and block the IP address of the source in the WAF
- B. Create new credentials for the user and restrict access to the authorized application.
- C. Reset the user's account and implement a stronger lock-out policy.
- D. Install an IDS on the network to monitor suspicious activity

Answer: A

Explanation:

The administrator should track the source of the log-in attempts and block the IP address in the Web Application Firewall (WAF). This will prevent further unauthorized attempts from that source.

It is also advisable to reset the user's account credentials as a precautionary measure.

NEW QUESTION # 228

A company developed an online trading platform. The engineering team selected event-based scaling for the platform's underlying resources. The platform resources scale up with every 2,000 subscribed users. The engineering team finds out that although compute utilization is low, scaling is still occurring. Which of the following statements best explains why this is the case?

- A. Event-based scaling should not track user subscriptions.
- B. Event-based scaling does not scale down resources.
- C. Event-based scaling should not be triggered at the 2,000-user frequency.
- **D. Event-based scaling does not take resource load into account.**

Answer: D

Explanation:

Comprehensive and Detailed Step-by-Step

A . Event-based scaling does not scale down resources: Event-based scaling can scale both up and down depending on triggers.

B . Event-based scaling should not be triggered at the 2,000-user frequency: The frequency is a design choice but doesn't explain the behavior.

C . Event-based scaling should not track user subscriptions: Tracking users isn't inherently wrong, but it should align with resource load metrics.

D . Event-based scaling does not take resource load into account: Event-based scaling relies on predefined triggers (e.g., user count) and doesn't dynamically assess resource utilization, leading to inefficiencies.
