NEW QUESTION # 55
Which services are active after a Unisphere for PowerMax installation on a Microsoft Windows host?

- A. SYMAPI and symrdfg
- B. SMAS and smasdb
- C. SMASandSTP
- D. SMASandGNS

Answer: B

Explanation:
Step by Step Comprehensive Detailed Explanation:
When you install Unisphere for PowerMax on a Microsoft Windows host, it installs several services necessary for its operation. The two primary services that are active after installation are:
* SMAS (Storage Management Agent Service):This service is responsible for communication between the Unisphere server and the PowerMax storage array. It handles tasks like collecting data, sending commands, and receiving alerts from the array.

* smasdb:This service manages the local database used by Unisphere for storing configuration information, performance data, and other relevant information.
Why other options are incorrect:
* A. SYMAPI and symrdfg:SYMAPI is a command-line interface tool, not a service. symrdfg is a service related to SRDF (Symmetrix Remote Data Facility) replication, which may not be active if SRDF is not configured.
* B. SMASandGNS:GNS is not a standard service associated with Unisphere for PowerMax.
* C. SMASandSTP:STP is not a standard service associated with Unisphere for PowerMax.

NEW QUESTION # 56
What are two characteristics of a SnapVX Clone?

- A. Can be made secure
- B. Is Read-only
- C. Restores directly to the source volume
- D. Maximum 1024 snaps per volume
- E. Can be made crash consistent

Answer: A,E

Explanation:
Step by Step Comprehensive Detailed Explanation:
* SnapVX Clones:SnapVX clones are full, writable copies of a source volume created using the SnapVX snapshot technology. They are independent volumes that can be used for various purposes, such as testing, development, or data analysis.
* Secure Snapshots:SnapVX offers the capability to create "secure snapshots." When a clone is derived from a secure snapshot, it inherits the same protection, making it immutable and preventing any modifications or deletion. This ensures data integrity and protection against accidental or malicious changes.
* Crash Consistent:SnapVX clones can be made crash consistent. This means that the clone captures a point-in-time copy of the source volume that is consistent with a database or application crash. This is important for ensuring data integrity and recoverability in situations where the source volume experiences an unexpected outage.
Why other options are incorrect:
* A. Maximum 1024 snaps per volume:This limit applies to the source volume, not the clones themselves. Each clone is an independent volume.
* C. Restores directly to the source volume:Clones are independent copies and do not directly restore to the source volume. Data can be copied or moved from the clone to the source if needed.
* D. Is Read-only:SnapVX clones are fully writable copies, not read-only.
