# Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Sample Questions (Q34-Q39):

### NEW QUESTION # 34
How often does Self-Service (formerly Calm) automatically clean up the database?

- A. Every 3 weeks
- B. Every 3 months
- C. Every 6 weeks
- D. Every 6 months

**Answer: B**

Explanation:
Self-Service (formerly Calm) automatically cleans up the database every 3 months. This regular maintenance task helps manage database size and performance by removing old and unnecessary data.
Reference:
Nutanix Calm documentation on Database Cleanup.
Nutanix Best Practices for Calm Maintenance.

### NEW QUESTION # 35
What is the purpose of an approval policy in Self-Service governance?

- A. To restrict access to Self-Service application
- B. To configure network settings within blueprints
- C. To require authorization before task execution
- D. To define VM sizing rules for each blueprint

**Answer: C**

### NEW QUESTION # 36
In order to give Consumers the ability to modify attributes, what should the Blueprint creator implement in the design?

- A. HTTP task with built-in macros
- B. Custom actions
- C. Runtime variables
- D. eScript task with custom macros

**Answer: C**

Explanation:
Runtime variables are variables that can be modified by the Consumer during the deployment of a Blueprint or after the deployment is complete. They allow the Consumer to customize the attributes of the infrastructure and applications according to their needs. Runtime variables can be defined in the Blueprint settings or in the Blueprint YAML file. They can also be used in the Blueprint tasks to pass dynamic values to the scripts or commands. Runtime variables can be of different types, such as text, number, boolean, list, or password. They can also have default values, constraints, and descriptions to guide the Consumer.

### NEW QUESTION # 37

An administrator has just noticed that a play is stuck in a suspended state.
What is possible reason for this issue?

- A. Autopilot was set for Wait for approval for every attempt.
- B. The playbook was set with a Manual trigger and required being resourced.
- C. The playbook is in a disabled status.
- D. Autopilot status is set to disabled.

**Answer: B**

Explanation:
When a play is stuck in a suspended state, a common reason is that the playbook was set with a Manual trigger and requires manual intervention to proceed. This can occur if the playbook is designed to pause at a certain step, waiting for an administrator or user to manually approve or provide additional input before continuing.

**NEW QUESTION # 38**
A task has failed in a Multi VM Blueprint deployment due to a typographical error. The error has been fixed.
What action should the administrator take to launch the Blueprint again?

- A. Clone the fixed Blueprint and move it to another project.
- B. Choose Skip task and let the Blueprint continue.
- C. Delete the failed application and relaunch the Blueprint.
- D. Choose Retry task and let the Blueprint continue.

**Answer: D**

Explanation:
When a task fails in a Multi VM Blueprint deployment within Nutanix Calm due to an issue such as a typographical error, and the error has been corrected, the administrator has options to handle the situation without needing to start the entire process from scratch.
According to Nutanix Calm documentation, the appropriate action after fixing the error is to choose the "Retry task" option. This allows the deployment process to continue from the point of failure, saving time and resources as opposed to deleting and relaunching the entire application or moving the blueprint to another project.
