Palo Alto Networks Cybersecurity Practitioner Sample Questions (Q220-Q225):

NEW QUESTION # 220

Which endpoint protection security option can prevent malware from executing software?

- A. URL filtering
- B. DNS Security
- C. Dynamic access control
- D. Application allow list

Answer: D

Explanation:

An application allow list prevents malware from executing by only permitting approved applications to run on an endpoint. Any unauthorized or unknown software, including malicious programs, is automatically blocked from executing.

NEW QUESTION # 221

Which term describes data packets that move in and out of the virtualized environment from the host network or a corresponding traditional data center?

- A. Intrazone traffic
- B. East-West traffic
- C. Interzone traffic
- D. North-South traffic

Answer: D

Explanation:

North-South traffic refers to the data packets that move between the virtualized environment and the external network, such as the internet or a traditional data center. This traffic typically involves requests from clients to access applications or services hosted on virtual machines (VMs) or containers, or responses from those VMs or containers to the clients. North-South traffic can also include management or monitoring traffic from external devices to the virtualized environment. NEW QUESTION # 222

Which statement describes a host-based intrusion prevention system (HIPS)?

- A. It analyzes network traffic to detect unusual traffic flows and new malware.
- B. It is placed as a sensor to monitor all network traffic and scan for threats.
- C. It scans a Wi-Fi network for unauthorized access and removes unauthorized devices.
- D. It is installed on an endpoint and inspects the device.

Answer: D

Explanation:

A Host-Based Intrusion Prevention System (HIPS) is installed directly on an endpoint device (such as a server or workstation) and monitors local system activity, including processes, file access, and system calls, to detect and prevent malicious behavior.

NEW QUESTION # 223

Which of the following is a CI/CD platform?

- A. Jira
- B. Atom.io
- **C. Jenkins**
- D. Github

Answer: C

Explanation:

A CI/CD platform is a comprehensive set of tools that help developers, engineers, and DevOps practitioners package and deliver software to the end users. A CI/CD platform automates the process of software testing and deployment, and enables faster and more reliable software releases. Jenkins is a popular open source CI/CD platform that supports a wide range of plugins and integrations to build, test, and deploy various types of applications. Jenkins can be configured to run on different platforms, such as Linux, Windows, or Docker, and can work with various version control systems, such as Git, SVN, or Mercurial. Jenkins can also orchestrate complex workflows, such as parallel or sequential execution, conditional branching, or parameterized triggering, using a graphical interface or a declarative syntax. Jenkins can help developers and DevOps teams achieve continuous integration and continuous delivery/deployment, by providing features such as:

* Pipeline as code: Jenkins allows users to define and manage their pipelines as code, using a domain-specific language (DSL) called Jenkinsfile. This enables users to store, version, and reuse their pipeline configurations, and to apply best practices such as code review and testing.

* Distributed builds: Jenkins can scale up or down to meet the demand of concurrent builds, by distributing the workload across multiple agents or nodes. This improves the performance and efficiency of the CI/CD process, and allows users to leverage different environments and resources for different stages of the pipeline.

* Plugin ecosystem: Jenkins has a rich and active community that contributes to its plugin ecosystem, which extends its functionality and compatibility with various tools and technologies. Users can find and install plugins from the Jenkins Plugin Manager, or create their own custom plugins using Java or Groovy.

* Blue Ocean: Jenkins offers a modern and user-friendly web interface called Blue Ocean, which simplifies the creation and visualization of pipelines. Blue Ocean provides features such as real-time feedback, interactive editing, branch and pull request support, and integration with popular chat platforms, such as Slack or Microsoft Teams.

- A. They are able to prevent evasive threats.
- B. They have failover capability.
- **C. They are dynamically scalable.**
- D. They possess unlimited throughput capability.

Answer: C

Explanation:

Virtual firewalls offer the advantage of dynamic scalability, making them ideal for internal segmentation in data centers. They can be quickly deployed, resized, and adjusted to meet the needs of changing workloads and environments, unlike physical firewalls which require fixed hardware resources.
