Which action resolves the EtherChannel issue between SW2 and SW3?

- A. Configure switchport mode trunk on SW2.
- **B. Configure channel-group 1 mode active on both interfaces.**
- C. Configure channel-group 1 mode desirable on both interfaces.
- D. Configure switchport nonegotiate on SW3

Answer: B

Explanation:

EtherChannel can be established using either the Port Aggregation Protocol (PAgP), which is Cisco proprietary, or the Link Aggregation Control Protocol (LACP), which is part of an IEEE standard. Both protocols facilitate the automatic creation of EtherChannel links.

In the scenario provided, the EtherChannel issue between SW2 and SW3 can be resolved by configuring both interfaces to use LACP, which is indicated by the 'mode active' setting. This setting allows the interfaces to actively negotiate an EtherChannel link with connected devices that are also set to either active or passive mode for LACP.

The 'mode active' configuration ensures that both switches will send LACP packets to each other, attempting to establish the EtherChannel link. If both sides are set to 'mode active', they will form an EtherChannel if they are able to negotiate successfully.
