Exam Mule-Dev-202 Question, Mule-Dev-202 Latest Test Question

In order to meet the different demands of the different customers, these experts from our company have designed three different versions of the Mule-Dev-202 reference guide. All customers have the right to choose the most suitable version according to their need after buying our study materials. The PDF version of the Mule-Dev-202 exam prep has many special functions, including download the demo for free, support the printable format and so on. We can make sure that the PDF version of the Mule-Dev-202 Test Questions will be very convenient for all people. Of course, if you choose our study materials, you will have the chance to experience our PDF version.

Salesforce Certified MuleSoft Hyperautomation Developer Sample Questions (Q17-Q22):

NEW QUESTION # 17

A non-technical employee from AnyAirlines creates a hyperautomation solution. The solution needs to meet the following criteria:
The process needs to begin when a record is created in Salesforce.

Then, it needs to pass data to a pre-existing RPA process which includes a User Task for data integrity purposes.

The output of the RPA process needs to be used to create a record in NetSuite.

According to best practices, how should this automated process be structured?

- A. 1. A Salesforce flow triggers on the creation of the record and makes an outbound request to a MuleSoft Composer flow.2. Then, the same MuleSoft Composer flow calls the RPA process and uses the result to create a record in NetSuite.
- B. 1. A MuleSoft Composer flow triggers on the creation of the record and calls the RPA process.2. Then, the same flow

uses the response to create a record in NetSuite. B 1. A Salesforce flow triggers on the creation of the record and calls too RPA process. 2. Then, the same flow uses the response to create a record in NetSuite.

- C. 1. A MuleSoft Composer flow triggers on the creation of the record and calls the RPA process. 2. Then, a second MuleSoft Composer flow triggers when the RPA process is completed and creates a record in NetSuite.

Answer: B

Explanation:

To structure the automated process to meet the given criteria, the following approach is recommended:

MuleSoft Composer Flow Triggers on Record Creation:

Use MuleSoft Composer to create a flow that is triggered when a new record is created in Salesforce. This is done by setting up a trigger event in MuleSoft Composer that listens for new record creation events in Salesforce.

Call the RPA Process:

Once the flow is triggered, it should call the pre-existing RPA process. MuleSoft Composer can invoke MuleSoft RPA bots, and you can pass the necessary data from the Salesforce record to the RPA process.

The RPA process will include the User Task for data integrity purposes.

Use the RPA Process Output to Create a Record in NetSuite:

After the RPA process completes, the MuleSoft Composer flow can capture the output from the RPA process.

The same MuleSoft Composer flow will then use this output to create a record in NetSuite, ensuring a seamless data transfer and process automation.

NEW QUESTION # 18

Northern Trail Outfitters (NTO) uses Flow Orchestration to automate quote development. The "Review Quote" work item is performed by their team of technical writers but can be fulfilled by any technical writer on the team.

How can NTO ensure the "Review Quote" work item is assigned to the correct Salesforce user?

- A. Use MuleSoft RPA to review the document and submit it for approval if no issues are found.
- B. Create a user collection variable and assign the work item to the user collection.
- C. Use backend steps to automate work item assignment to the next available technical writer.
- D. Create a Group for the team of Salesforce Users and assign the work item to the group.

Answer: D

Explanation:

To ensure the "Review Quote" work item is assigned to the correct Salesforce user within the team of technical writers, the following approach can be used:

Creating a Group:

Create a Group in Salesforce that includes all the technical writers who are eligible to perform the "Review Quote" work item. This group acts as a collective resource pool.

Assigning the Work Item to the Group:

When the "Review Quote" work item is created in Flow Orchestration, assign it to the group rather than an individual user.

Salesforce will then allow any available technical writer within the group to pick up and complete the task.

Ensuring Flexibility and Availability:

This method ensures that the work item can be completed by any technical writer in the team, providing flexibility and improving the chances of timely completion by utilizing the group's collective availability.

NEW QUESTION # 19

An RPA process is invoked by a MuleSoft Composer flow. The RPA process has a User Task that can take up to 24 hours to complete.

- A. Wait for the RPA process to complete and invoke a second MuleSoft Composer flow via REST API.
- B. Wait for the RPA process to complete and use the results in the same MuleSoft Composer flow.
- C. Create a second MuleSoft Composer flow that starts when the RPA process is complete.
- D. Create a second MuleSoft Composer flow that runs on a schedule and checks if the RPA process is complete.

- E. Using best practices, how should the results be consumed by MuleSoft Composer?

Answer: C

Explanation:

When an RPA process involves a User Task that can take a significant amount of time (up to 24 hours) to complete, it is best to use a follow-up mechanism to handle the results once the process is finished:

Second MuleSoft Composer Flow:

Create a second MuleSoft Composer flow that is triggered when the RPA process completes. This ensures that the first flow is not held up while waiting for the long-running RPA process to finish.

The second flow can start based on an event, such as the completion status of the RPA process, ensuring timely and efficient processing of the results.

Trigger Mechanism:

Configure the RPA process to notify MuleSoft Composer when it is complete, possibly using a REST API or another integration method.

Best Practices:

This approach adheres to best practices by keeping flows modular and focused on specific tasks, making them easier to manage and troubleshoot.

NEW QUESTION # 20

Northern Trail Outfitters wants to run a bidirectional sync of data between two Salesforce orgs. They want to perform real-time updates between both systems so that if either system is updated, the other one is automatically updated with the new data.

What is the minimum number of MuleSoft Composer flows needed to meet this requirement?

- A. 0
- B. 1
- **C. 2**
- D. 3

Answer: C

Explanation:

To achieve a bidirectional sync between two Salesforce orgs using MuleSoft Composer, you would need a minimum of two flows.

Flow 1: Sync from Org A to Org B: This flow monitors changes in Org A and updates Org B with the new data whenever a change occurs.

Flow 2: Sync from Org B to Org A: Similarly, this flow monitors changes in Org B and updates Org A with the new data whenever a change occurs.

This setup ensures that any change in either Salesforce org is reflected in the other, maintaining real-time synchronization between the two systems.

NEW QUESTION # 21

AnyAirlines wants to share the Flight Path API through their public Anypoint Exchange Portal.

What should be configured before the API can be shared?

- A. The API should be functional and accessible for users to interact with.
- B. The API should be secured using one of the supported authentication/authorization mechanisms.
- C. The users that need access to the API should be added to the appropriate role in Anypoint Platform.
- **D. The visibility level of API instances should be set to public.**

Answer: D

Explanation:

Before sharing an API on the public Anypoint Exchange Portal, several configurations must be in place:

Set Visibility Level to Public:

Ensure the API's visibility level is configured as public within the Anypoint Platform so that it can be shared and accessed by external

users.

Navigate to Anypoint Platform > API Manager > Select the API > Settings > Set Visibility to Public.

Ensure API Functionality and Accessibility:

Make sure the API is fully functional and accessible so that users can interact with it once shared.

Configure Security:

While setting the visibility to public is crucial, ensuring that the API is secured using one of the supported authentication/authorization mechanisms is a best practice to control access.
