Answer: C

NEW QUESTION # 148
A security analyst has received a report that servers are no longer able to connect to the network. After many hours of troubleshooting, the analyst determines a Group Policy Object is responsible for the network connectivity Issues. Which of the following solutions should the security analyst recommend to prevent an interruption of service in the future?

- A. CI/CD pipeline
- B. Change management process
- C. Appropriate network segmentation
- D. Impact analysis and reporting

Answer: B

Explanation:
A change management process is a set of procedures that ensures that any changes to a system or service are planned, tested, approved, implemented and documented in a controlled and consistent manner. A change management process can prevent an interruption of service caused by a Group Policy Object (GPO) by ensuring that the GPO is properly configured, tested and authorized before applying it to the servers. A change management process can also provide a way to roll back or undo the changes if they cause any problems.
A CI/CD pipeline is a method of delivering software applications that involves continuous integration (CI) and continuous delivery (CD). CI is the process of merging code changes from multiple developers into a shared repository and testing them automatically. CD is the process of deploying the code changes to different environments (such as testing, staging and production) and releasing them to customers. A CI/CD pipeline does not prevent an interruption of service caused by a GPO, but rather helps to deliver software applications faster and more reliably.
An impact analysis and reporting is a process of assessing the potential effects of a change on a system or service, such as performance, availability, security and compatibility. An impact analysis and reporting can help to identify and mitigate any risks or issues associated with a change. However, an impact analysis and reporting does not prevent an interruption of service caused by a GPO, but rather helps to evaluate and communicate the consequences of a change.
Appropriate network segmentation is a practice of dividing a network into smaller subnetworks or segments based on different criteria, such as function, location or security level. Appropriate network segmentation can improve the performance, security and manageability of a network by reducing congestion, isolating threats and controlling access. However, appropriate network segmentation does not prevent an interruption of service caused by a GPO, but rather helps to protect and optimize a network.

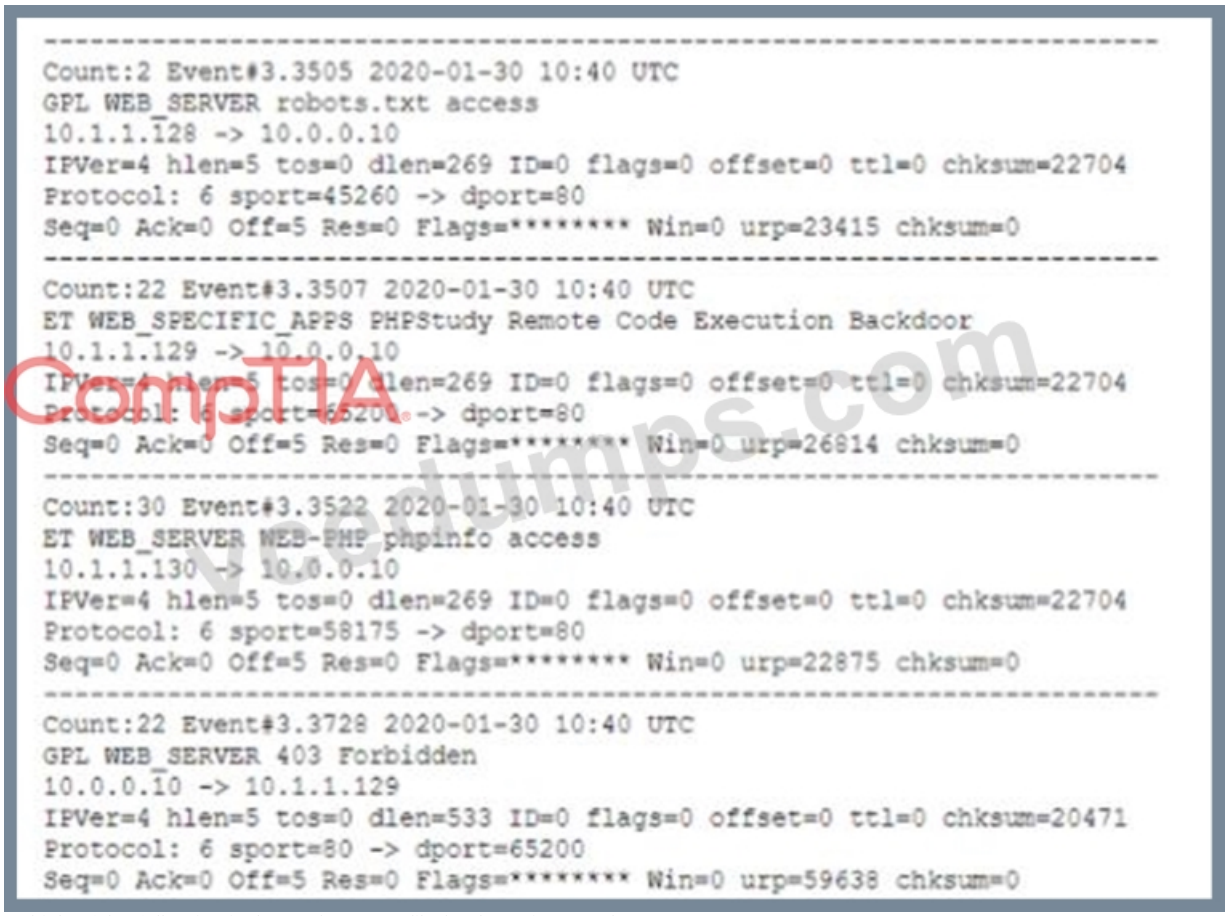
NEW QUESTION # 150
A security analyst is reviewing the network security monitoring logs listed below:



Which of the following is the analyst most likely observing? (Select two).

- A. 10.1.1.129 can determine mat port 443 is being used
- B. 10.1.1.129 successfully exploited a vulnerability on the web server
- C. 10.1.1.128 sent malicious requests, and the alert is a false positive
- D. 10.1.1.130 can potentially obtain information about the PHP version
- E. 10.1.1.128 sent potential malicious traffic to the web server.
- F. 10.1.1.129 sent potential malicious requests to the web server

Answer: D,F

Explanation:
A security analyst is reviewing the network security monitoring logs listed below and is most likely observing that 10.1.1.129 sent potential malicious requests to the web server and that 10.1.1.130 can potentially obtain information about the PHP version. The logs show that 10.1.1.129 sent two requests to the web server with suspicious parameters, such as "union select" and "or 1=1", which are commonly used for SQL injection attacks. The logs also show that 10.1.1.130 sent a request to the web server with a parameter "phpinfo", which is a function that displays information about the PHP configuration and environment, which can be useful for attackers to find vulnerabilities or exploit them.
