Simulations Nutanix NCP-MCA Pdf & Valid NCP-MCA Study Plan

Memorizing these Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) NCP-MCA valid dumps will help you easily attempt the Nutanix NCP-MCA exam within the allocated time. Thousands of aspirants have passed their Nutanix NCP-MCA Exam, and they all got help from our Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) NCP-MCA updated exam dumps. For successful preparation, you can also rely on NCP-MCA real questions.

Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Sample Questions (Q55-Q60):

NEW QUESTION # 55

Refer to the exhibit.

A subset of Linux VMs is required to be gracefully shutdown each evening. A Playbook is created to shut down the targeted VMs, however, the error message shown in the error message when the Playbook is executed.

Data flow

Playbook execution terminated due to action failure.

Trigger

Manual

Action

Power of vm

Error message Failed to with Internal Error. VM power state task failed to complete. status: Error: INTERNAL_ERROR: Errorcode: 9 What is causing the error message?

- A. The VM is Off.
- B. The VM is missing Nutanix Guest Tool.
- C. executing the not have privileges.
- D. **The SSH Service is not running on the VMs.**

Answer: D

Explanation:

The error message "INTERNAL_ERROR: ErrorCode: 9" typically indicates an issue with the SSH service on the VMs. In this context, where a playbook is being executed to shut down Linux VMs, it's essential that the SSH service is running to allow for remote management and execution of commands. If the SSH service isn't running, the playbook won't be able to execute commands on the VMs, leading to an internal error.

Nutanix Multicloud Automation Administration (NMCAA) Course, Module 3: X-Play, Lesson 3.3: Creating and Managing Playbooks, Slide 19: Action Settings Nutanix Certified Professional - Multicloud Automation (NCP-MCA) Exam Blueprint Guide, Section 3: Validate Blueprints, Playbooks, and Automation Settings, Objective 3.3: Determine the correct method to validate required Playbook configurations

NEW QUESTION # 56

Where would a blueprint developer give the application admins the ability to Upgrade, Scale In and Scale Out their Application?

- A. Task Library
- B. **Custom Profile Actions**
- C. Custom Service Actions
- D. Runbooks

Answer: B

Explanation:

In a Nutanix Self-Service Blueprint, actions that affect the entire application lifecycle or its structural configuration are defined as Profile Actions.

* Application Profile Actions: These are operations that run at the level of the Application Profile.

* Custom Profile Actions: To enable capabilities like Scale Out (adding more replicas), Scale In (removing replicas), or Upgrade (updating the application software across the deployment), the developer creates Custom Profile Actions.

* These actions are distinct from "Service Actions" (which apply to a single VM/Service, like "Restart Apache").

* Once defined, these Custom Profile Actions appear as buttons on the "Manage" tab of the deployed application, allowing the application admin to trigger the scaling or upgrade workflows defined by the developer.

NEW QUESTION # 57

The administrator receives the below error when deleting an Application from a Self-Service (formerly Calm) blueprint for a Linux VM when using a custom script as part of the Delete system action:

□

Which two steps should the administrator take to delete the deployment? (Choose two.)

- A. Perform a Delete
- B. Perform a Stop
- C. Perform a Soft Delete
- D. Manually delete the VM

Answer: B,D

Explanation:

The error indicates that there is an issue with DNS resolution while executing the delete script. To resolve this and successfully delete the deployment, the administrator can:

* Perform a Stop: Stop the application or VM to ensure that no processes are actively using the resources. This might resolve any temporary network or DNS issues.

* Manually delete the VM: If stopping the application does not resolve the issue, manually deleting the VM from the Prism Central or the respective hypervisor management console is necessary. This will bypass the script error.

NEW QUESTION # 58

A company has started a new project team and has asked an administrator to build the first blueprint for a new public cloud environment that was defined last week. This will be the first deployment to AWS.

The administrator has been given the following information:

VM Name: web01-@@{unique}@@

IP Address: Provider-assigned

OS version: Windows Server 2016

Deployment location: AWS

Region: us-west-1

Project: Default

What should the administrator do first when building the first blueprint?

- A. Create a new provider
- B. Create a new blueprint
- C. Create a new project
- D. Create a new service

Answer: B

NEW QUESTION # 59

Exhibit.

An administrator must launch applications deployments on any remote Prism Central (PC) from the PC hosting Calm Global.

What must the administrator do to satisfy this requirement?

- A. Create a Nutanix account any remote PE on Calm Global and add the account to the project.
- B. Create a Nutanix account for each remote PE on the local PC and add the accounts to the project.
- C. Create a Nutanix account for each remote PC on the local PC and add the accounts to the project.
- D. Create a Nutanix account for any remote PC on Calm Global and add the account to the project.

Answer: C

Explanation:

To launch application deployments on any remote Prism Central (PC) from the PC hosting Calm Global, the administrator must create a Nutanix account for each remote PC on the local PC (the one hosting Calm Global) and add these accounts to the relevant project. This setup allows Calm to manage and orchestrate resources across multiple Prism Central instances.
