## IBM MQ v9.4 Administrator - Professional Sample Questions (Q180-Q185):

### NEW QUESTION # 180

In IBM MQ, when a large retail organization needs to integrate point-of-sale systems, inventory databases, and supplier applications, the administrators want to ensure that messages are not only reliably delivered but also that they can be recovered in case of system crash by replaying from logs without requiring application-level intervention. Which configuration provides this capability?

- A. Enabling persistent messaging with recovery logs and write-ahead logging mechanism
- B. Using non-persistent queues with high throughput settings
- C. Allowing only application-controlled checkpoints for message recovery
- D. Using temporary queues with manual backup scripts for replay

**Answer: A**

Explanation:

Persistent messaging with write-ahead logging ensures that messages can be recovered and replayed by the queue manager after a crash, eliminating reliance on application-level recovery.

#### NEW QUESTION # 181

When performing backup and recovery of an IBM MQ queue manager in a production environment, which approach ensures minimal downtime and complete restoration of messages, subscriptions, and configurations in case of system failure?

- A. Relying solely on client-side message logs
- B. Using MQ's in-built backup utilities or taking a filesystem-level backup of the queue manager's data directory including logs and journal files
- C. Cloning the queue manager on a different server without stopping the active instance
- D. Copying only the queue manager configuration files without messages

**Answer: B**

Explanation:

A complete backup of the queue manager's data directory, including logs and journal files, ensures that messages, subscriptions, and configurations can be fully restored with minimal downtime.

#### NEW QUESTION # 182

In IBM MQ, which configuration approach correctly explains the use of cluster workload balancing, including how messages are automatically routed to the least busy queue manager in a cluster, how cluster repositories maintain topology information, and how sender and receiver channels work together to optimize throughput for multiple applications?

- A. Cluster workload balancing automatically routes messages to the least busy queue manager using cluster repositories for topology and sender/receiver channels for communication
- B. Clustering requires manual routing to balance workload
- C. Clustering only replicates queues to other queue managers without distributing workload
- D. Clustering duplicates messages to all queue managers without considering workload

**Answer: A**

Explanation:

IBM MQ cluster workload balancing uses cluster repositories to maintain information about queue managers, and sender/receiver channels automatically route messages to distribute workload efficiently, optimizing performance.

#### NEW QUESTION # 183

Which IBM MQ tool provides monitoring and management capabilities for queue managers, channels, queues, and subscriptions through a graphical interface, enabling administrators to analyze message flow, set alerts, and perform operational tasks efficiently?

- A. MQ Bridge
- B. Application programming interface
- C. MQSC command-line tool
- D. MQ Explorer

**Answer: D**

Explanation:

MQ Explorer is the graphical management tool for IBM MQ, offering monitoring, alerting, and administrative operations for queue managers and resources.

### NEW QUESTION # 184

In situations where administrators want to apply custom logic such as message transformation, validation, or additional security checks while messages pass through channels, which IBM MQ extension capability allows insertion of user-written code at specific points?

- A. Channel Exits
- B. Monitoring Agents
- C. Queue Aliases
- D. Dead Letter Handlers

**Answer: A**

Explanation:

Channel Exits are user-written programs that can be executed during message transmission, allowing organizations to implement custom processing and security controls.
