Penetration Testing: HPE7-A01 Pre-assessment Test

We have security and safety guarantee, which mean that you cannot be afraid of virus intrusion and information leakage since we have data protection acts, even though you end up studying HPE7-A01 test guide of our company, we will absolutely delete your personal information and never against ethic code to sell your message to the third parties. Our HPE7-A01 Exam Questions will spare no effort to perfect after-sales services. Thirdly countless demonstration and customer feedback suggest that our Aruba Certified Campus Access Professional Exam study question can help them get the certification as soon as possible, thus becoming the elite, getting a promotion and a raise and so forth.

Earning the Aruba Certified Campus Access Professional certification can open up new career opportunities in the field of IT networking. Aruba Certified Campus Access Professional Exam certification is recognized worldwide and demonstrates a level of expertise and proficiency in Aruba technologies. Additionally, certified professionals are eligible for advanced training and career advancement opportunities within their organizations.

HP Aruba Certified Campus Access Professional Exam Sample Questions (Q119-Q124):

NEW QUESTION # 119

Match the solution components of HPE Aruba Networking Central NetConductor (Options may be used more than once or not at all.)

Answer:

Explanation:

☐

Explanation:

☐

NEW QUESTION # 120

In AOS 10, which session-based ACL below will only allow ping from any wired station to wireless clients but will not allow ping from wireless clients to wired stations?

- A. ip access-list session pingFromWired any any svc-icmp deny any user svc-icmp permit
- B. ip access-list session pingFromWired any user any permit
- C. ip access-list session pingFromWired user any svc-icmp deny any any svc-icmp permit
- D. ip access-list session pingFromWired any any svc-icmp permit user any svc-icmp deny

Answer: A

Explanation:

A session-based ACL is applied to traffic entering or leaving a port or VLAN based on the direction of the session initiation. To allow ping from any wired station to wireless clients but not vice versa, a session-based ACL should be used to deny icmp echo traffic from any source to any destination, and then permit icmp echo-reply traffic from any source to user destination. The user role represents wireless clients in AOS 10.

NEW QUESTION # 121

Drag and Drop Question

Match the topics with the underlying technologies (Options may be used more than once or not at all.)

□

Answer:

Explanation:

□

NEW QUESTION # 122

A customer wants to enable wired authentication across all their CX switches. One of the requirements is that the switch must be able to authenticate a single computer connected through a VoIP phone.

Which feature should be enabled to support this requirement?

- A. Multi-Domain Authentication
- B. Device-Based Mode
- C. Multi-Auth Mode
- D. MAC Authentication

Answer: A

Explanation:

Multi-Domain Authentication is the feature that should be enabled to support the requirement that the switch must be able to authenticate a single computer connected through a VoIP phone.

Multi-Domain Authentication is a feature that allows an Aruba CX switch to apply different authentication methods and policies to different devices connected to the same port. For example, a VoIP phone and a computer can be connected to the same port using a single cable, but they can be authenticated separately using different credentials and assigned to different VLANs. The other options are incorrect because they either do not support multiple devices on the same port or do not provide authentication.

NEW QUESTION # 123

What is an Aruba-recommended best practice for hardening that only applies to Aruba CX 6300 series switches with dedicated management ports?

- A. Manually enable Enhanced Security Mode from a console session.
- B. Disable all management services on the default VRF.
- C. Implement a control plane ACL to limit access to approved IPs and/or subnets
- D. Create a dedicated management VRF, and assign the management port to it.

Answer: D

This is an Aruba-recommended best practice for hardening that only applies to Aruba CX 6300 series switches with dedicated management ports. A dedicated management port is a physical port that is used exclusively for out-of-band management access to the switch. A dedicated management VRF is a virtual routing and forwarding instance that isolates the management traffic from other traffic on the switch. By creating a dedicated management VRF and assigning the management port to it, the administrator can enhance the security and performance of the management access to the switch. The other options are incorrect because they either do not apply to switches with dedicated management ports or do not follow Aruba-recommended best practices.
