Cisco Certified Support Technician (CCST) Cybersecurity Sample Questions (Q262-Q267):

NEW QUESTION # 262

Which of the following control types is focused on identifying vulnerabilities and weaknesses in systems and addressing them?

- A. Compensating controls
- **B. Corrective controls**
- C. Detective controls
- D. Preventive controls

Answer: B

Explanation:

Corrective controls are designed to identify and rectify vulnerabilities and weaknesses in systems. They aim to correct issues identified through assessments, audits, or incident response, and ensure that the necessary steps are taken to minimize the associated risks. Examples of corrective controls include patch management, vulnerability scanning, and system hardening procedures.

NEW QUESTION # 263

Which of the following is an example of a secure remote access technology?

- A. Telnet
- B. FTP
- C. SNMP
- **D. SSH**

Answer: D

Explanation:

SSH (Secure Shell) is a secure remote access protocol that provides encrypted communication between remote devices. Unlike Telnet, which transmits data in plaintext, SSH encrypts the data, making it more secure for remote access to devices or systems. FTP (File Transfer Protocol) and SNMP (Simple Network Management Protocol) are not specifically designed for remote access and do not provide the same level of security as SSH.

NEW QUESTION # 264

Which of the following is a key advantage of multifactor authentication?

- A. It eliminates the need for strong passwords.
- B. It simplifies the authentication process.
- C. It provides enhanced security by requiring multiple proofs of identity.
- D. It allows for anonymous access to systems and resources.

Answer: C

Explanation:

Multifactor authentication enhances security by requiring users to present multiple proofs of identity. By combining different factors, such as something you know, something you have, or something you are, it becomes more difficult for unauthorized individuals to gain access. This approach adds an extra layer of protection compared to relying solely on a username and password combination.

NEW QUESTION # 265

Which of the following is a characteristic of an IPv6 address?

- A. Uses colons as separators
- B. Can be represented by both decimal and binary notation
- C. Consists of 32 bits
- D. Supports a maximum of 4.3 billion unique addresses

Answer: A

Explanation:

An IPv6 address consists of 128 bits, which is four times the size of an IPv4 address. Unlike IPv4 addresses that use periods (dots) as separators, IPv6 addresses use colons as separators. For example, an IPv6 address could be written as 2001:0db8:85a3:0000:0000:8a2e:0370:7334.

NEW QUESTION # 266

Which security measure can prevent unauthorized devices from automatically connecting to a corporate network through unused switch ports?

- A. Port security
- B. NAT
- C. VPN
- D. VLAN trunking

Answer: A

Explanation:

The CCST Cybersecurity Study Guide explains that port security on switches can be configured to limit the number of MAC addresses allowed on a port, or to restrict it to specific devices.

"Port security can prevent unauthorized access by limiting or specifying the MAC addresses allowed to connect through a given switch port. This mitigates risks from rogue devices connecting to the network." (CCST Cybersecurity, Basic Network Security Concepts, Switch Security section, Cisco Networking Academy)
