Palo Alto Networks XSIAM Analyst Sample Questions (Q66-Q71):

NEW QUESTION # 66
For a critical incident, Cortex XSIAM suggests several playbooks which should have been executed automatically.

Why were the playbooks not executed?

- A. Misconfiguration of the connector instance has occurred.
- B. Playbook classifier was not configured for the alert type.
- C. Playbook loggers were not configured for those alerts.
- D. Installation of the appropriate content pack was not completed.

Answer: D

Explanation:
The correct answer is C - Installation of the appropriate content pack was not completed.
If the relevant playbooks are not executed automatically-even though Cortex XSIAM suggests them-it is often due to the required content pack not being installed. Playbooks and their dependencies are delivered through content packs, and unless the content pack is fully installed and enabled, those playbooks cannot run automatically.
"Playbooks may not execute if the required content pack is not installed or enabled in Cortex XSIAM." Document Reference: XSIAM Analyst ILT Lab Guide.pdf Page: Page 38 (Automation and Playbooks section)

NEW QUESTION # 67
How can a SOC analyst highlight alerts generated on C-level executive hosts?

- A. Create a dynamic group for the C-level hosts.
- B. Create a Featured Alert field for the C-level hosts
- C. Add the C-level executive users to the Executive Accounts asset role.
- D. Add a tag to the C-level executive users

Answer: C

Explanation:
The correct answer is A - Add the C-level executive users to the Executive Accounts asset role.
By assigning C-level executives to the Executive Accounts asset role, any alerts generated from those accounts or devices are highlighted and given higher visibility in Cortex XSIAM.
"Adding C-level users to the Executive Accounts asset role ensures that related alerts are highlighted and prioritized." Document Reference: XSIAM Analyst ILT Lab Guide.pdf Page: Page 49 (Asset and User Management section)

NEW QUESTION # 68
Which interval is the duration of time before an analytics detector can raise an alert?

- A. Test period
- B. Deduplication period
- C. Training period
- D. Activation period

Answer: C

Explanation:
The correct answer isC - Training period.
Analytics detectors within Cortex XSIAM utilize atraining periodto establish a baseline of normal behavior.
During this interval, the detector learns and identifies patterns and behaviors that are considered normal within the environment. Once the training period is complete, the detector can accurately detect and raise alerts on anomalies.
Other intervals mentioned do not match the definition:
* Activation period:Refers to the time from activation to full functionality.
* Test period:Typically refers to internal or manual testing stages.
* Deduplication period:The time during which similar alerts are suppressed.
"Analytics detectors require an initial training period to learn normal patterns before being able to accurately raise alerts." Document Reference:EDU-270c-10-lab-guide_02.docx (1).pdf Exact Page:Page 28 (Alerting and Detection Processes Section)

NEW QUESTION # 69
An alert surfaces for a file hash tied to recent ransomware. What should you do next?
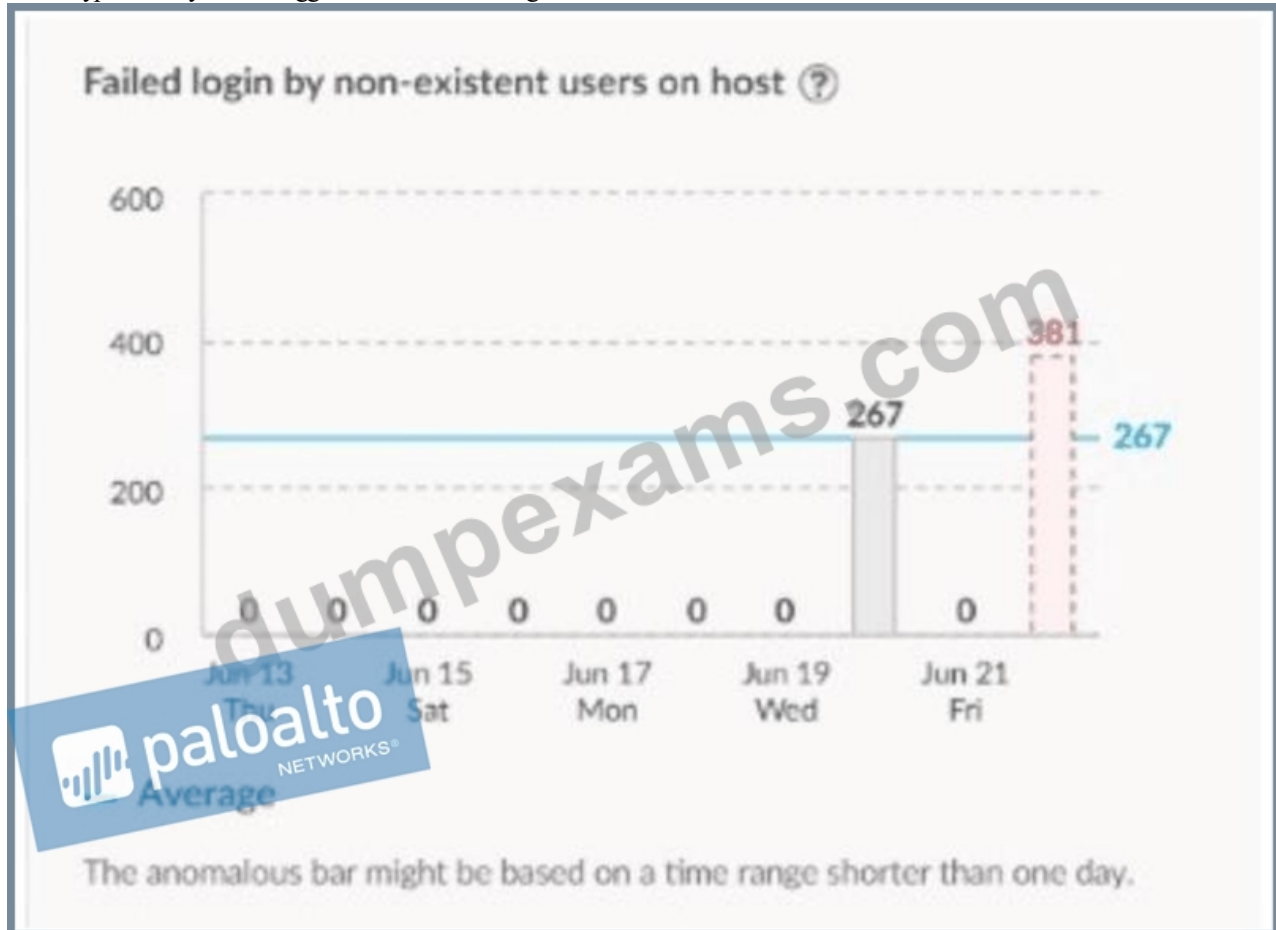

(Choose two)
Response:

- A. Disable live terminal access
- B. Isolate all endpoints globally
- C. Add the hash to a detection rule
- D. Review its reputation and relationships

Answer: C,D

NEW QUESTION # 70
Which type of analytics will trigger the alert on the image shown?

Failed login by non-existent users on host ⑦

The anomalous bar might be based on a time range shorter than one day.

- A. Behavioral
- B. Anomaly
- C. Contextual
- D. Baseline

Answer: B

Explanation:
Comprehensive and Detailed Explanation From Exact Extract:
The correct answer isD - Anomaly.
In Cortex XSIAM,Anomaly analyticsare designed to trigger alerts when a monitored activity deviates significantly from the established baseline or historical average. In the image, the "Failed login by non- existent users on host" metric remains at zero for several days and then suddenly spikes to 267 and 381-far above the average threshold. This significant deviation from the established norm is identified by the analytics engine as ananomalyand will trigger an alert for further investigation.
"Anomaly analytics identify significant deviations from established baselines or averages, such as unusual spikes in failed login attempts or other behavioral outliers, and trigger alerts for potential threats."
